1. Introduction 7
1.1. Restcomm jSS7
1.2. About SS7
1.3. Implemented Protocols and Standards Compliance 8
1.4. Major Features of Restcomm jSS7
2. Architecture
2.1. Logical Design
2.2. Directory Structure
2.3. Functional Blocks
2.3.1. SS7 Service
2.3.1.1. Stack Usage
2.3.2. Signaling Gateway
2.3.3. Shell - Comman Line Interface
2.3.4. Graphical User Interface
2.3.5. SS7 Simulator
2.3.5.1. Simulator Layers
3. Multi tenancy support
4. Running
4.1. Running Restcomm SS7 Service
4.2. Running Restcomm Signaling Gateway
4.2.1. Start the Gateway
4.2.2. Stop the Gateway
4.2.3. Bind the Gateway to IP
4.3. Running jSS7 as a Standalone library. 27
4.4. Running the Shell`Shell`
4.4.1. Start the Shell Client
4.4.2. Connect to Managed Instance
4.4.3. Disconnect
4.4.4. Authentication and Audit Logs
4.4.4.1. Security
4.4.4.2. Audit Configuration
4.4.5. Command-line Completion

4.5. Running the Graphical User Interface	31
4.5.1. Connect to a new Instance	32
4.5.2. Authentication	32
4.6. Running Restcomm jSS7 Simulator	32
4.6.1. Running the Simulator Locally	33
4.6.2. Running SS7 Simulator remotely	35
5. Configuring jboss-beans.xml	41
5.1. Configuring Restcomm SS7 Service	41
5.1.1. Configuring M3UA	41
5.1.2. Configuring dahdi	43
5.1.3. Configuring dialogic	44
5.1.4. Configuring MTP3 routing label	45
5.1.5. Configuring SCCP	46
5.1.6. Configuring TCAP	48
5.1.7. Configuring ShellExecutor	50
5.1.8. Configuring MAP	51
5.1.9. Configuring CAP	51
5.1.10. Configuring ISUP	52
5.1.11. Configuring SS7Service	52
5.1.12. Configuring jSS7 Management Service	54
5.2. Configuring Restcomm Signaling Gateway	56
5.2.1. Configuring M3UA (Signaling Gateway)	56
5.2.2. Configuring LinksetFactory	58
5.2.3. Configuring LinksetManager	58
5.2.4. Configuring ShellExecutor	59
5.2.5. Configuring SignalingGateway	60
6. Configuring as a Standalone library	61
6.1. Building SCTP	61
6.2. Building M3UA	62
6.3. Building SCCP	63
6.4. Building TCAP	65
6.5. Building MAP	65
6.6. Common Code	66
7. Managing Restcomm jSS7.	67
7.1. Linkset Management	67
7.1.1. Using CLI	67
7.1.2. Using GUI	67
7.1.3. View all Linksets and Links	68
7.1.3.1. Using CLI	68
7.1.3.2. Using GUI.	69
7.1.4. Create a new Linkset	69

7	1.4.1 Using CLI	69
, 7	1.4.2. Using GUI	70
7.1.	5. Remove a Linkset	71
7	.1.5.1. Using CLI	71
7	.1.5.2. Using GUI	71
7.1.	6. Activate Linkset	71
7	.1.6.1. Using CLI	71
7	.1.6.2. Using GUI	72
7.1.	7. Deactivate Linkset	72
7	.1.7.1. Using CLI	72
7	.1.7.2. Using GUI	73
7.1.	8. Create a new Link	73
7	.1.8.1. Using CLI	73
7	.1.8.2. Using GUI	74
7.1.	9. Remove a Link	75
7	.1.9.1. Using CLI	75
7	.1.9.2. Using GUI	75
7.1.	10. Activate Link	75
7	.1.10.1. Using CLI	75
7	.1.10.2. Using GUI	76
7.1.	11. Deactivate Link	76
7	.1.11.1. Using CLI	76
7	.1.11.2. Using GUI	77
7.2. SC	TP Management	77
7.2.	1. Using CLI	77
7.2.	2. Using GUI	77
7.2.	3. SCTP stack properties.	78
7	.2.3.1. Connect Delay.	78
	7.2.3.1.1. Using CLI	78
	7.2.3.1.2. Using GUI	79
7	.2.3.2. Single Thread	79
	7.2.3.2.1. Using CLI	80
	7.2.3.2.2. Using GUI	80
7	.2.3.3. Worker Threads	80
	7.2.3.3.1. Using CLI	81
	7.2.3.3.2. Using GUI	81
7.2.	4. View all SCTP (or TCP) Server Instances	82
7	.2.4.1. Using CLI	82
7	.2.4.2. Using GUI	82
7.2.	5. Create a new SCTP (or TCP) Server Instance	83
7	.2.5.1. Using CLI	83

7.2.5.2. Using GUI
7.2.6. Delete a SCTP (or TCP) Server Instance
7.2.6.1. Using CLI
7.2.6.2. Using GUI
7.2.7. Start a SCTP (or TCP) Server Instance
7.2.7.1. Using CLI
7.2.7.2. Using GUI
7.2.8. Stop a SCTP (or TCP) Server Instance
7.2.8.1. Using CLI
7.2.8.2. Using GUI
7.2.9. View all SCTP (or TCP) Associations
7.2.9.1. Using CLI
7.2.9.2. Using GUI
7.2.10. Create a new SCTP (or TCP) Association
7.2.10.1. Using CLI
7.2.10.2. Using GUI
7.2.11. Delete a SCTP (or TCP) Association 92
7.2.11.1. Using CLI
7.2.11.2. Using GUI
7.3. M3UA Management
7.3.1. Using CLI
7.3.2. Using GUI
7.3.3. M3UA stack properties
7.3.3.1. Maximum Sequence Number. 94
7.3.3.1.1. Using CLI
7.3.3.1.2. Using GUI
7.3.3.2. Maximum AS for route
7.3.3.2.1. Using CLI
7.3.3.2.2. Using GUI
7.3.3.3. Heart Beat time
7.3.3.3.1. Using CLI
7.3.3.3.2. Using GUI
7.3.4. View all M3UA Application Server Processes
7.3.4.1. Using CLI
7.3.4.2. Using GUI
7.3.5. Create a new M3UA Application Server Process
7.3.5.1. Using CLI
7.3.5.2. Using GUI
7.3.6. Delete an Application Server Process
7.3.6.1. Using CLI
7.3.6.2. Using GUI

7.3.7. Start an Application Server Process	101
7.3.7.1. Using CLI	102
7.3.7.2. Using GUI.	102
7.3.8. Stop an Application Server Process	102
7.3.8.1. Using CLI	102
7.3.8.2. Using GUI	103
7.3.9. View all M3UA Application Servers	103
7.3.9.1. Using CLI	103
7.3.9.2. Using GUI	104
7.3.10. Create a new M3UA AS	105
7.3.10.1. Using CLI	105
7.3.10.2. Using GUI	107
7.3.11. Delete a M3UA AS	107
7.3.11.1. Using CLI	107
7.3.11.2. Using GUI	108
7.3.12. Assign an ASP to an AS	108
7.3.12.1. Using CLI	108
7.3.12.2. Using GUI	109
7.3.13. Unassign an ASP from an AS	110
7.3.13.1. Using CLI	110
7.3.13.2. Using GUI	111
7.3.14. View all M3UA Routes	111
7.3.14.1. Using CLI	111
7.3.14.2. Using GUI	112
7.3.15. Create a new M3UA Route	113
7.3.15.1. Using CLI	113
7.3.15.2. Using GUI	114
7.3.16. Delete a M3UA Route	114
7.3.16.1. Using CLI	114
7.3.16.2. Using GUI	115
7.4. SCCP Management	115
7.4.1. Using CLI	116
7.4.2. Using GUI	116
7.4.3. SCCP stack properties	117
7.4.3.1. SCCP protocol version	117
7.4.3.1.1. Using CLI	117
7.4.3.1.2. Using GUI	118
7.4.3.2. Maximum Data Message	118
7.4.3.2.1. Using CLI	118
7.4.3.2.2. Using GUI	119
7.4.3.3. Preview Mode	119

7.4.12. View all configured SCCP Addresses 137 7.4.12.1. Using CLI 137 7.4.12.2. Using GUI 137 7.4.13.1. Create a new Primary/Backup address 137 7.4.13.1. Using CLI 137 7.4.13.2. Using GUI 137 7.4.13.1. Using CLI 137 7.4.13.2. Using GUI 141 7.4.13.2. Using GUI 141 7.4.14.1. Using CLI 141 7.4.15. Delete a Primary/Backup Address 141 7.4.15.1. Using CLI 144 7.4.15.2. Using GUI 145 7.4.16.1. Using CLI 144 7.4.16.1. Using CLI 145 7.4.16.2. Using GUI 145 7.4.16.3. Using GUI 146 7.4.17.1. Sorting Algorithm 146 7.4.17.1. Sorting Algorithm 146 7.4.17.1. Sorting GUI 155 7.4.18. Using CLI 155 7.4.19. Delete a Rule 161 7.4.19. Using GUI 155 7.4.19. Using GUI 162 7.4.19.1. Using CLI 162 7.4.19.2. Using GUI 162 7.4.20.1. Using CLI <td< th=""></td<>
7.4.12.1. Using CLI. 137 7.4.12.2. Using GUI 137 7.4.13. Create a new Primary/Backup address 137 7.4.13.1. Using CLI. 137 7.4.13.2. Using GUI 141 7.4.13.2. Using GUI 141 7.4.14.1. Using CLI. 141 7.4.15.2. Using GUI 141 7.4.15.1. Using CLI. 141 7.4.15.1. Using CLI. 141 7.4.15.2. Using GUI 144 7.4.15.2. Using GUI 145 7.4.16. View all configured SCCP Rules. 145 7.4.16.2. Using GUI 146 7.4.17. Create a new SCCP Rule. 146 7.4.17.1. Sorting Algorithm 146 7.4.17.2. Using GUI 146 7.4.17.1. Sorting Algorithm 146 7.4.18.1. Using CLI. 147 7.4.18.1. Using CLI. 155 7.4.18.1. Using CLI. 155 7.4.19. Delete a Rule 161 7.4.19. Delete a Rule 161 7.4.19. Using GUI 162 7.4.20.1. Using CUI 162 7.4.20.2. Using GUI 162 7.4.20.2. Using GUI
7.4.12.2. Using GUI 137 7.4.13. Create a new Primary/Backup address 137 7.4.13.1. Using CLI 137 7.4.13.2. Using GUI 141 7.4.13.2. Using GUI 141 7.4.14.1. Using CLI 141 7.4.15. Delete a Primary/Backup Address 141 7.4.15.1. Using CLI 141 7.4.15.2. Using GUI 144 7.4.15.2. Using GUI 144 7.4.15.2. Using GUI 145 7.4.16. View all configured SCCP Rules. 145 7.4.16.2. Using GUI 146 7.4.17.1. Sorting Algorithm 146 7.4.17.2. Using CLI. 147 7.4.17.3. Using GUI 146 7.4.17.3. Using GUI 146 7.4.17.1. Sorting Algorithm 146 7.4.17.3. Using GUI 155 7.4.18.1. Using CLI. 155 7.4.18.1. Using CLI. 162 7.4.19. Delete a Rule 161 7.4.19.1. Using CLI. 162 7.4.20.1. Using GUI 162 7.4.20.2. Using GUI 162 7.4.20.2. Using GUI 163 7.4.21. Using GUI <t< td=""></t<>
7.4.13. Create a new Primary/Backup address 137 7.4.13.1. Using CLI 137 7.4.13.2. Using GUI 141 7.4.13.2. Using GUI 141 7.4.14. Modify a Primary/Backup Address 141 7.4.15.1. Using CLI 141 7.4.15.1. Using CLI 144 7.4.15.2. Using GUI 144 7.4.15.2. Using GUI 144 7.4.15.2. Using GUI 145 7.4.16.1. Using CLI 145 7.4.16.1. Using CLI 145 7.4.16.2. Using GUI 146 7.4.17. Create a new SCCP Rules 146 7.4.17.2. Using CLI 147 7.4.17.3. Orting Algorithm 146 7.4.17.3. Using GUI 146 7.4.17.3. Using GUI 146 7.4.17.3. Using GUI 155 7.4.18.1. Using CLI 157 7.4.19.1. Delete a Rule 161 7.4.19.1. Using CLI 162 7.4.20. View all configured Remote Signaling Points (RSP) 162 7.4.20. Using GUI 163 7.4.21. Using CLI 162 7.4.21. Using GUI 163 7.4.21. Using GUI<
7.4.13.1. Using CLI 137 7.4.13.2. Using GUI 141 7.4.13.2. Using GUI 141 7.4.14.1. Modify a Primary/Backup Address 141 7.4.15.1. Using CLI 141 7.4.15.1. Using CLI 141 7.4.15.1. Using CLI 144 7.4.15.2. Using GUI 145 7.4.16.1. Using CLI 144 7.4.16.2. Using GUI 145 7.4.16.3. Using CLI 145 7.4.16.4. Using CLI 145 7.4.16.2. Using GUI 146 7.4.17. Create a new SCCP Rule 146 7.4.17.2. Using CLI 147 7.4.17.3. Orting Algorithm 146 7.4.17.3. Using GUI 147 7.4.17.3. Using GUI 146 7.4.17.3. Using GUI 155 7.4.18.1. Using CLI 155 7.4.19.1. Delete a Rule 161 7.4.19.1. Using CLI 162 7.4.20. View all configured Remote Signaling Points (RSP) 162 7.4.20.1. Using GUI 162 7.4.20.2. Using GUI 163 7.4.21.1. Using CLI 163 7.4.21.2. Using GUI
7.4.13.2. Using GUI 141 7.4.13.2. Using GUI 141 7.4.14. Modify a Primary/Backup Address 141 7.4.15. Delete a Primary/Backup Address 144 7.4.15. Delete a Primary/Backup Address 144 7.4.15. Using CLI 144 7.4.15.2. Using GUI 144 7.4.16.1. Using CLI 145 7.4.16.1. Using CLI 145 7.4.16.2. Using GUI 145 7.4.16.2. Using GUI 146 7.4.17. Create a new SCCP Rules 146 7.4.17.1. Sorting Algorithm 146 7.4.17.2. Using CLI 147 7.4.18. Modify a SCCP Rule 155 7.4.18. Jusing GUI 154 7.4.19. Delete a Rule 161 7.4.19. Delete a Rule 161 7.4.19. Using CLI 162 7.4.20. View all configured Remote Signaling Points (RSP) 162 7.4.20. Using GUI 163 7.4.21. Create a new Remote Signaling Pointcode 163 7.4.21. Using CLI 163 7.4.21. Using CLI 163 7.4.21. Using GUI 164 7.4.21. Using CLI 163
7.4.14. Modify a Primary/Backup Address 141 7.4.14.1. Using CLI. 141 7.4.15. Delete a Primary/Backup Address 144 7.4.15. Discrete a Primary/Backup Address 144 7.4.15. Using CLI. 144 7.4.15. Using CLI. 144 7.4.16. View all configured SCCP Rules. 145 7.4.16.1. Using CLI. 145 7.4.16.2. Using GUI 146 7.4.17. Create a new SCCP Rule. 146 7.4.17. Create a new SCCP Rule. 146 7.4.17.2. Using CLI. 147 7.4.17.3. Using GUI 155 7.4.18. Modify a SCCP Rule 155 7.4.18. I. Using CLI. 147 7.4.19. Delete a Rule 161 7.4.19. Luing CLI. 155 7.4.19. Luing CLI. 162 7.4.20. View all configured Remote Signaling Points (RSP) 162 7.4.20. Using GUI 163 7.4.21. Create a new Remote Signaling Pointcode 163 7.4.21. Using CLI. 163 7.4.21. Using CLI. 163 7.4.21. Using CLI. 163 7.4.21. Using CLI. 163 7.4.21. Using
7.4.14.1. Using CLI 141 7.4.15. Delete a Primary/Backup Address 144 7.4.15. Using CLI 144 7.4.15.2. Using GUI 145 7.4.16. View all configured SCCP Rules. 145 7.4.16.1. Using CLI 145 7.4.16.2. Using GUI 146 7.4.16.1. Using CLI 146 7.4.16.2. Using GUI 146 7.4.17.1. Create a new SCCP Rule 146 7.4.17.1. Sorting Algorithm 146 7.4.17.3. Using GUI 147 7.4.17.3. Using GUI 147 7.4.18.1. Using CLI 155 7.4.18.1. Using CLI 155 7.4.18.1. Using CLI 155 7.4.19. Delete a Rule 161 7.4.19.1. Using CLI 162 7.4.20. View all configured Remote Signaling Points (RSP) 162 7.4.20. Using GUI 163 7.4.21. Using CLI 163 7.4.21. Using CLI 163 7.4.21. Using GUI 163 7.4.21. Using GUI 163 7.4.21. Using GUI 163 7.4.21. Using GUI 163 7.4.21. Using GUI <td< td=""></td<>
7.4.15. Delete a Primary/Backup Address 144 7.4.15.1. Using CLI 144 7.4.15.2. Using GUI 145 7.4.16. View all configured SCCP Rules. 145 7.4.16.1. Using CLI 145 7.4.16.2. Using GUI 146 7.4.16.2. Using GUI 146 7.4.16.2. Using GUI 146 7.4.16.3. Orign Algorithm 146 7.4.17.1. Sorting Algorithm 146 7.4.17.2. Using CLI 147 7.4.17.3. Sorting Algorithm 146 7.4.17.3. Using GUI 154 7.4.18.1. Using CLI 155 7.4.18.1. Using CLI 155 7.4.18.1. Using CLI 155 7.4.19. Delete a Rule 161 7.4.19.2. Using GUI 162 7.4.20. View all configured Remote Signaling Points (RSP) 162 7.4.20. Using GUI 163 7.4.21. Create a new Remote Signaling Pointcode 163 7.4.21. Using CLI 163 7.4.21. Using GUI 164 7.4.22. Modify a Remote Signaling Pointcode 165 7.4.23. Delete a Remote Signaling Pointcode 165
7.4.15.1. Using CLI 144 7.4.15.2. Using GUI 145 7.4.16. View all configured SCCP Rules. 145 7.4.16.1. Using CLI 145 7.4.16.2. Using GUI 146 7.4.16.7. Create a new SCCP Rule 146 7.4.17. Create a new SCCP Rule 146 7.4.17.1. Sorting Algorithm 146 7.4.17.2. Using CLI 147 7.4.17.3. Using GUI 154 7.4.18. Modify a SCCP Rule 155 7.4.18. Modify a SCCP Rule 155 7.4.18. Modify a SCCP Rule 155 7.4.18.1. Using CLI 155 7.4.19.1. Using CLI 162 7.4.19.2. Using GUI 162 7.4.20.2. Using GUI 162 7.4.20.1. Using CLI 162 7.4.20.2. Using GUI 163 7.4.21. Create a new Remote Signaling Pointcode 163 7.4.21. Using CLI 163 7.4.21. Using GUI 164 7.4.22. Modify a Remote Signaling Pointcode 165 7.4.22. Modify a Remote Signaling Pointcode 165 7.4.23. Delete a Remote Signaling Pointcode 165
7.4.15.2. Using GUI 145 7.4.16. View all configured SCCP Rules 145 7.4.16.1. Using CLI 145 7.4.16.2. Using GUI 146 7.4.17. Create a new SCCP Rule 146 7.4.17. Create a new SCCP Rule 146 7.4.17.1. Sorting Algorithm 146 7.4.17.2. Using CLI 147 7.4.17.3. Using GUI 154 7.4.18. Modify a SCCP Rule 155 7.4.18. Modify a SCCP Rule 155 7.4.18.1. Using CLI 155 7.4.19. Delete a Rule 161 7.4.19.1. Using CLI 162 7.4.19.2. Using GUI 162 7.4.20.2. Using GUI 162 7.4.20.3. Using GUI 163 7.4.21. Using CLI 163 7.4.21. Using CLI 163 7.4.21. Using GUI 163 7.4.21. Using GUI 163 7.4.22. Modify a Remote Signaling Pointcode 163 7.4.22. Modify a Remote Signaling Pointcode 165 7.4.23. Delete a Remote Signaling Pointcode 165 7.4.23. Delete a Remote Signaling Pointcode 165 7.4.23. Delete a Remote Signaling Poi
7.4.16. View all configured SCCP Rules 145 7.4.16.1. Using CLI 145 7.4.16.2. Using GUI 146 7.4.17. Create a new SCCP Rule 146 7.4.17. Create a new SCCP Rule 146 7.4.17. Appendix A: Revision History	

Preface

Document Conventions

This manual uses several conventions to highlight certain words and phrases and draw attention to specific pieces of information.

In PDF and paper editions, this manual uses typefaces drawn from the Liberation Fonts set. The Liberation Fonts set is also used in HTML editions if the set is installed on your system. If not, alternative but equivalent typefaces are displayed. Note: Red Hat Enterprise Linux 5 and later includes the Liberation Fonts set by default.

Typographic Conventions

Four typographic conventions are used to call attention to specific words and phrases. These conventions, and the circumstances they apply to, are as follows.

Mono-spaced Bold

Used to highlight system input, including shell commands, file names and paths. Also used to highlight key caps and key-combinations. For example:

To see the contents of the file *my_next_bestselling_novel* in your current working directory, enter the cat <code>my_next_bestselling_novel</code> command at the shell prompt and press Enter to execute the command.

The above includes a file name, a shell command and a key cap, all presented in Mono-spaced Bold and all distinguishable thanks to context.

Key-combinations can be distinguished from key caps by the hyphen connecting each part of a keycombination. For example:

Press Enter to execute the command.

Press to switch to the first virtual terminal. Press to return to your X-Windows session.

The first sentence highlights the particular key cap to press. The second highlights two sets of three key caps, each set pressed simultaneously.

If source code is discussed, class names, methods, functions, variable names and returned values mentioned within a paragraph will be presented as above, in Mono-spaced Bold. For example:

File-related classes include filesystem for file systems, file for files, and dir for directories. Each class has its own associated set of permissions.

Proportional Bold

This denotes words or phrases encountered on a system, including application names; dialogue box text; labelled buttons; check-box and radio button labels; menu titles and sub-menu titles. For

example:

Choose **System** > **Preferences** > **Mouse** from the main menu bar to launch Mouse Preferences. In the Buttons tab, click the Left-handed mouse check box and click **[Close]** to switch the primary mouse button from the left to the right (making the mouse suitable for use in the left hand).

To insert a special character into a gedit file, choose Applications > Accessories > Character Map from the main menu bar. Next, choose Search > Find >] from the Character Map menu bar > type the name of the character in the Search field and click [Next. The character you sought will be highlighted in the Character Table. Double-click this highlighted character to place it in the Text to copy field and then click the [Copy] button. Now switch back to your document and choose Edit > Paste from the gedit menu bar.

The above text includes application names; system-wide menu names and items; applicationspecific menu names; and buttons and text found within a GUI interface, all presented in Proportional Bold and all distinguishable by context.

Note the menu:>[] shorthand used to indicate traversal through a menu and its sub-menus. This is to avoid the difficult-to-follow 'Select from the **Preferences** >] **sub-menu in the menu:System[** menu of the main menu bar' approach.

Mono-spaced Bold Italic or Proportional Bold Italic

Whether Mono-spaced Bold or Proportional Bold, the addition of Italics indicates replaceable or variable text. Italics denotes text you do not input literally or displayed text that changes depending on circumstance. For example:

To connect to a remote machine using ssh, type ssh username@domain.name at a shell prompt. If the remote machine is *example.com* and your username on that machine is john, type ssh john@example.com.

The mount -o remount file-system command remounts the named file system. For example, to remount the */home* file system, the command is mount -o remount /home.

To see the version of a currently installed package, use the rpm -q package command. It will return a result as follows: package-version-release.

Note the words in bold italics above —username, domain.name, file-system, package, version and release. Each word is a placeholder, either for text you enter when issuing a command or for text displayed by the system.

Aside from standard usage for presenting the title of a work, italics denotes the first use of a new and important term. For example:

When the Apache HTTP Server accepts requests, it dispatches child processes or threads to handle them. This group of child processes or threads is known as a *server-pool*. Under Apache HTTP Server 2.0, the responsibility for creating and maintaining these server-pools has been abstracted to a group of modules called *Multi-Processing Modules (MPMs*). Unlike other modules, only one module from the MPM group can be loaded by the Apache HTTP Server.

Pull-quote Conventions

Two, commonly multi-line, data types are set off visually from the surrounding text.

Output sent to a terminal is set in Mono-spaced Roman and presented thus:

booksDesktopdocumentationdraftsmssphotosstuffsvnbooks_testsDesktop1downloadsimagesnotesscriptssvgs

Source-code listings are also set in Mono-spaced Roman but are presented and highlighted as follows:

```
package org.jboss.book.jca.ex1;
import javax.naming.InitialContext;
public class ExClient
{
  public static void main(String args[])
      throws Exception
  {
     InitialContext iniCtx = new InitialContext();
     Object
                     ref
                            = iniCtx.lookup("EchoBean");
     EchoHome
                            = (EchoHome) ref;
                     home
                            = home.create();
     Echo
                     echo
     System.out.println("Created Echo");
     System.out.println("Echo.echo('Hello') = " + echo.echo("Hello"));
  }
}
```

Notes and Warnings

Finally, we use three visual styles to draw attention to information that might otherwise be overlooked.

Note

0

A note is a tip or shortcut or alternative approach to the task at hand. Ignoring a note should have no negative consequences, but you might miss out on a trick that makes your life easier.

Important

Important boxes detail things that are easily missed: configuration changes that only apply to the current session, or services that need restarting before an update will apply. Ignoring Important boxes won't cause data loss but may cause irritation and frustration.

П

Warning

A Warning should not be ignored. Ignoring warnings will most likely cause data loss.

Provide feedback to the authors!

If you find a typographical error in this manual, or if you have thought of a way to make this manual better, we would love to hear from you! Please submit a report in the the {this-issue.tracker.ur}, against the product Restcomm jSS7``, or contact the authors.

When submitting a bug report, be sure to mention the manual's identifier: Restcomm jSS7

If you have a suggestion for improving the documentation, try to be as specific as possible when describing it. If you have found an error, please include the section number and some of the surrounding text so we can find it easily.

Chapter 1. Introduction

1.1. Restcomm jSS7

Restcomm jSS7 is the only Open Source Java based implementation of the SS7 protocol stack. It provides implementation for MTP2, MTP3, ISUP, SCCP, TCAP, CAMEL (Phase I, Phase II, Phase III and Phase IV) and MAP protocols for a dedicated equipment. It also has in-built support for SIGTRAN (M3UA) over IP and strictly adheres to the standards and specifications defined by the International Telecommunications Union (ITU) and American National Standards Institute (ANSI). The platform offers developers with a flexible API set that hides the lower layer details (legacy SS7 links or SIGTRAN) and therefore makes it simple and easy to develop SS7 applications as well as to migrate your applications from TDM equipments to M3UA. Restcomm jSS7 is based on an easily scalable and configurable load-balancing architecture.

Restcomm jSS7 supports TDM hardware offered by major vendors in the market, namely Intel family boards (Dialogic) and Zaptel/Dahdi (Digium, Sangoma).

If you intend to use only M3UA you can install the jSS7 on any Operating System that supports Java. However if you wish to use SS7 cards, the native libaries for these are only compiled for Linux at the moment. Restcomm jSS7 can work as a standalone library. However if you wish to use JSLEE Resource Adapters, the Command Line Interface (Shell Management tool) or the GUI Management Console for run-time configuration, then you must have JBoss Application Server installed and running. Restcomm jSS7 comes with JSLEE TCAP, MAP, CAP and ISUP Resource Adaptors (RA) that enable developers to build SS7 applications with ease. Developers only require an understanding of Resource Adaptors and can focus on building applications quickly and efficiently rather than worry about the SS7 stack.

The Open Source Software gives you the flexibility to understand the readily available source code and customise the product for your Enterprise needs.

This guide provides details on configuring and using the platform and information regarding the supported protocols and compliant standards. For installation instructions, please refer to the Installation Guide published along with this.

1.2. About SS7

SS7 (Signaling System No.7) is a set of signaling protocols defined for information exchange in telephony. It is the global standard for telecommunications and is defined by the International Telecommunication Union (ITU) - Telecommunication Standardization Sector (ITU-T). It is also commonly referred to as Common Channel Signaling System No. 7 (i.e., SS7 or C7).

In telephony (wireless and wireline), the information associated with a call must be exchanged between a telephone and the telephone exchange or between exchanges, transit nodes and other elements in the network. Information exchange is required to set up, control and tear down calls and this exchange of information is called Signaling. SS7 is the global standard that defines the procedures and protocol to be followed by network elements in the Public Switched Telephone Network (PSTN) in order to exchange information over a digital signaling network to effect wireless

(cellular) and wireline call setup, route, control, monitor and terminate.

The ITU definition of SS7 allows for national variants such as the American National Standards Institute (ANSI) and Bell Communications Research (Telcordia Technologies) standards used in North America and the European Telecommunications Standards Institute (ETSI) standard used in Europe.

The hardware and software functions of the protocol are divided into functional abstractions called "levels". These levels map loosely to the Open Systems Interconnect (OSI) 7-layer model defined by the International Standards Organization (ISO).

[ss7 fig3] | images/ss7-fig3.gif

1.3. Implemented Protocols and Standards Compliance

Restcomm jSS7 is a software based implementation of the SS7 protocol. It provides implementation for Level 2 and above in the SS7 protocol Stack. The Restcomm jSS7 is a platform in the sense that it does not provide the application itself but rather allows users to build their own SS7 applications using Restcomm jSS7 as a platform.

The figure below depicts the various SS7 protocols implemented by Restcomm jSS7 .

Restcomm jSS7 adheres to the standards specified by ITU and ANSI. The table below depicts the implementation standards compliance matrix.

Table 1. Standards Compliance

Stack	Compliance
ISUP	ITU-T Q.761 to Q.764 and Q.767
SCCP	ITU-T Q.711 to Q.716, ANSI T1.112-2000

Stack	Compliance
TCAP	ITU-T Q.771 to Q.775, ANSI T1.114-2000
MAP	GSM 09.02, GSM 29.002, GSM 03.40
CAP	GSM 09.78 - CAMEL Phase - I, II, III and IV
M3UA	RFC 4666

M3UA, SCCP and TCAP stacks are compliant with ANSI standard. ANSI support for MAP, CAP and ISUP is not ready.

1.4. Major Features of Restcomm jSS7

Java-based

Restcomm jSS7 is the only Java based SS7 stack. It is robust and reliable and can be installed on any Operating System that supports Java (JDK 7 and SCTP).

Open Source

The Software is open-source, giving you the freedom the understand the code and customise it to your enterprise needs. It is supported by a vibrant Open source community.

SS7 Hardware Cards

Restcomm jSS7 can be used with Intel family boards (Dialogic SS7 cards) or Zaptel/Dahdi compatible TDM devices (Digium, Sangoma).

SIGTRAN (M3UA)

It also has in-built support for SIGTRAN (M3UA using SCTP).Restcomm jSS7 M3UA is based on RFC 4666 and supports ASP, SGW or IPSP modes. It supports both Single Exchange and Double Exchange of messages.

Flexibile and Consistent API

It offers a flexible and consistent API set to develop SS7 applications quickly and efciently irrespective of the lower layer details (legacy SS7 links or SIGTRAN). For example, applications using Restcomm jSS7 SCCP (and/or upper layers) can be easily migrated from TDM equipments to Restcomm jSS7 M3UA with just configuration changes without having to modify a single line of code.

Standalone or JSLEE RA

You can use it as a standalone library or make use of JSLEE RA (Resource Adaptors) that come with it to manage the Stack and develop applications effectively.

Easy Configuration and Management

Restcomm jSS7 comes with an efficient Command Line Interface (CLI) tool allowing you to completely configure the Stack at run-time and manage it using simple commands rather than do everything manually. Restcomm jSS7 also comes with a Graphical User Interface that will allow you to configure, monitor and manage the Stack through a convenient user-friendly interface.

Scalability

Restcomm jSS7 is easily scalable with a configurable load-balancing architecture.

Statistics

Restcomm jSS7 provides teal time statistics at TCAP level indicating number of dialogs, components, error's etc for given time period

Technical Specifications

Restcomm jSS7 is not restricted by any license or Transaction Per Second model. The only restricting factor is memory + CPU capacity of the host servers.

- Restcomm SCTP supports as many associations as supported by the underlying Operating System.
- Restcomm M3UA can be confgured to have as many ASP's / IPSP's as needed by the system.
- Restcomm SCCP can be confgured to have virtually unlimited Global Title Translation rules and also supports wild characters for partial matching of Global Title digits.

Chapter 2. Architecture

2.1. Logical Design

The Restcomm jSS7 is logically divided into two sections - lower and upper.

- The lower section provides implementation for SS7 Level 2 and Level 3. This section is therefore influenced by the type of SS7 hardware (Level 1) used.
- The upper section provides implementation for SS7 Level 4 and above.

This logical division offers great flexibility where hardware is concerned. Irrespective of the type of hardware used in the lower section, Restcomm jSS7 Level 4 and above remains the same. Since the API set is consistent regardless of the lower layers, you can easily migrate your applications from TDM equipments to M3UA. For example, applications using Restcomm SCCP stack (and/or upper layers) can easily be migrated from TDM equipments to Restcomm M3UA with just configuration changes and without changing a single line of code.

Restcomm jSS7 is designed efficiently to offer you the flexibility to install and use the Levels 2,3 and 4 in the same JVM and machine where SS7 Hardware (Level 1) is installed. Alternately, you can also install Level 1,2 and 3 in one machine and install Level 4 on a separate machine. In the second scenario, M3UA over SCTP is used for communication between Level 3 and Level 4 (on different machines) and this is referred to as Restcomm Signaling Gateway. The figures below illustrate the above 2 scenarios.

Scenario 1: The complete Restcomm jSS7 is installed in one machine.

The above two sce

Scenario 2: Restcomm Signaling Gateway - Level 3 and below are installed on one machine and

Level 4 is installed on a different machine.

NIF - Nodal Interworking Function

If you use Restcomm M3UA stack, you must use JDK 7 to run the stack as well as to compile the source code. M3UA leverages Java SCTP which is available only in JDK 7.

For more details regarding installation, please refer to the Restcomm jSS7 Installation Guide.

2.2. Directory Structure

The top-level directory is named - and immediately below this are five sub-directories named *asn*, _*docs*, *oam*, *sctp* and *ss7*. All the functional modules of the Stack reside in the *ss7* folder.

The following is a description of the important services and libraries that make up Restcomm jSS7

asn

Abstract Syntax Notation One (ASN.1) library is used by various Restcomm jSS7 protocols to encode/decode the structured data exchanged between Signaling Points over networks. For more details on the asn library, refer to the document included in the _docs folder. Applications using any of the Restcomm jSS7 User Protocols may never need to call an asn API directly, however it must be in the classpath since Restcomm jSS7 User Protocols refer to this library.

docs

All relevant documentation for Restcomm jSS7.

oam

UI Management module

sctp

Stream Control Transmission Protocol (SCTP) Library provides the APIs over Java SCTP. This library will be used only if M3UA layer is used. For more details on the sctp library, refer to the documentation included in the *docs* folder.

ss7

This folder contains the core protocol libraries that will be used by end applications as well as by the SS7 Service deployed in JBoss AS. The sub-directories included in the *ss7* folder are:

- restcomm-ss7-sgw : Standalone Signaling Gateway
- *restcomm-ss7-service* : SS7 service is the core engine and is used in conjunction with JBoss AS. The installation guide will teach you to install the Stack as a standalone component if you do not wish to run it as a JBoss AS Service.
- restcomm-ss7-simulator : SS7 Simulator is an application for testing the SS7 stack and

displaying its functionality. It is also a good example of how to use this stack.

- *restcomm-ss7-traceparser* : mobicents jSS7 Stack Trace Parser is a simple tool that can parse trace capture data files (of some formats) and log its content in some log file in a text form
- *protocols* : Restcomm jSS7 User Protocols libraries. Your application will directly call the APIs exposed by these libraries. Depending on the application, you may be interested in either TCAP or MAP, or both, or ISUP libraries.
- shell : This holds the Command Line Interface (CLI) module to manage the Restcomm jSS7 .
- template : This folder contains templates that are needed for JSS7 stack configuring.

2.3. Functional Blocks

The major functional modules of the jSS7 are:

- 1. SS7 Service [dir: restcomm-ss7-service]
- 2. Signaling Gateway [dir: restcomm-ss7-sgw]
- 3. Shell [dir: shell]
- 4. GUI [dir: ui]
- 5. SS7 Simulator restcomm-ss7-simulator]

The following sub-sections discuss in detail about the functionality of these individual components.

2.3.1. SS7 Service

SS7 Service creates an instance of higher layer of the Restcomm Stack and binds the instance to JNDI. SS7 Service is a JMX based service deployed in JBoss Application Server. It hides the underlying details like whether Level 4 and above are connected to peer via M3UA or if connected to the SS7 Hardware installed in the same machine as Level 4.

Following services are bound:

Table 2. SS7 Services

Stack Name	JNDI Name	Comments
ТСАР	java:/restcomm/ss7/tcap	Exposes TCAP Stack via JNDI
MAP	java:/restcomm/ss7/map Exposes	MAP Stack via JNDI
CAP	java:/restcomm/ss7/cap Exposes	CAP Stack via JNDI
ISUP	java:/restcomm/ss7/isup	Exposes ISUP stack via JNDI

The figure below depicts the elements that are deployed as part of the SS7 MAP Service.

Figure 1. Restcomm jSS7 Stack Service Elements

SS7 Service Elements serve the following purposes:

Expose protocol access points

Access points allow users to access lower layer protocols like MAP and interact with the SS7 network through such protocols.

Expose management interface

Shell Executor allows the Shell client to connect and issue commands.

The figure below depicts the elements that are deployed as part of SS7 Service.

Figure 2. Restcomm jSS7 Stack Service Elements

For more details on Running and Configuring the SS7 Service Elements, please refer to the chapter Running.

2.3.1.1. Stack Usage

The figure below depicts how Restcomm jSS7 is used.

Figure 3. Restcomm jSS7 Stack General Design

2.3.2. Signaling Gateway

Restcomm Signaling Gateway (SG) is a signaling agent that receives and sends Switched Circuit Network (SCN) native signaling at the edge of the IP network. Restcomm Signaling Gateway leverages MTP and Restcomm M3UA Stack explained in Restcomm Signaling Gateway M3UA Stack.

The figure below shows the components included in Restcomm Signaling Gateway. Configuring the Signaling Gateway is explained in the chapter Running.

Figure 4. Restcomm Signaling Gateway Components

2.3.3. Shell - Comman Line Interface

Shell is a Command Line Interface (CLI) tool that will allow you to manage different aspects of

Restcomm jSS7 in an interactive manner. It connects to different instances of Restcomm jSS7 which manages Linksets, SCCP resource, routing and M3UA. Usually Shell will be invoked from a remote machine(remote to Linksets and application protocols).

2.3.4. Graphical User Interface

The Graphical User Interface will allow you to manage different aspects of Restcomm jSS7 through a convenient user-friendly interface. You can launch the GUI in any Web Browser and manage the Stack instance efficiently using the GUI operations.

2.3.5. SS7 Simulator

Restcomm jSS7 comes with a Simulator that will help you to understand the functionality of the Stack. The Simulator may be used as an application for testing the SS7 Stack or as an example of how to use this Stack. You can run several instances of the Simulator in a single machine and each instance can have its own configuration. In addition, the Simulator offers you the flexibility to run it locally or remotely. You must remember to configure all layers before running tests with the Simulator.

The Simulator contains three layers of SS7 stack components and one testing task layer which presents the concrete testing task. You can select from these layers as required, however some layers demand corresponding lower layers. For example, the TCAP+MAP layer demands SCCP as layer 2. Depending on your testing goals, you can configure each of these layers separately but the configuration options are limited and do not cover all possible SS7 Stack options.

2.3.5.1. Simulator Layers

- 1. Layer 1 [MTP3]
 - M3UA
 - DialogicCard
 - DahdiCard [yet to be implemented]
- 2. Layer 2
 - SCCP
 - ISUP [yet to be implemented]
- 3. Layer 3
 - TCAP + MAP
 - TCAP + CAP
 - TCAP + INAP [yet to be implemented]
- 4. Testing Task Layer
 - USSD client test
 - USSD server test
 - SMS server test
 - SMS client test

- CAP SSF test
- CAP SCF test
- MAP ATI client test
- MAP ATI server test
- MAP Check IMEI client test
- MAP Check IMEI server test

Chapter 3. Multi tenancy support

Multi tenancy allows same instance of Restcomm jSS7 to connect to different operators, each having its own links and point-codes.

Multi tenancy is achieved by having a model of SS7 network as a splitted to several logical networks. Each logical network has a corresponded key "networkId". It is digital one and default value (if we do not specify it) - 0.

NetworkId value is assigned for a configurable objects:

- SCCP SAP
- SCCP Rule

NetworkId is also assigned to activities:

- SccpMessage (assigned by Service Acess Point SAP for SS7 originated messages, assigned by TCAP Dialog for TCAP originated messages)
- TCAP Dialog (assigned by SccpMessage for SCCP originated messages, assigned by upper Dialog for user messages)
- MAP / CAP Dialog (same as TCAP Dialog)
- SCCP rule is taken into account only when SCCP rule networkId == SccpMessage networkId

Chapter 4. Running

You must ensure that you follow the steps outlined in the Restcomm jSS7 Installation Guide to install the Components. As explained in the Installation Guide, you may install jSS7 as a standalone library or as a JBoss AS SS7 Service or as a Signaling Gateway. Once installed, you can run the different Components as described in the sections below.

4.1. Running Restcomm SS7 Service

Procedure: Start SS7 Service

- 1. Pre-requisite: You must have SS7 Service deployed in the JBoss Application Server as explained in the Installation Guide.
- All you have to do to start the Service is start the JBoss AS. This will automatically start the SS7 Service. To start the JBoss Server you must execute the *run.sh* (Unix) or *run.bat* (Microsoft Windows) startup script in the *<jboss_install_directory>/bin* folder (on Unix or Windows).
- 3. Result: If the service started properly you should see following lines in the Unix terminal or Command Prompt depending on your environment:

```
[TomcatDeployment] deploy, ctxPath=/admin-console
14:07:47,580 INFO
14:07:47,650 INFO

```

4. If you are starting Restcomm-jSS7-7.4.0-162 for the first time, SS7 is not configured. You need to use the Shell Client to connect to Restcomm-jSS7-7.4.0-162. Using CLI you can configure how service interacts with SS7 network, that is you configure either installed SS7 card and its native library, or M3UA layer. You can also use the GUI to achieve the same. Once configured, the state and configuration of SS7 is persisted which stands server re-start.

Procedure: Stop SS7 Service

- To stop the SS7 service, you must shut down the JBoss Application Server. To shut down the server(s) you must execute the shutdown.sh -s (Unix) or shutdown.bat -s (Microsoft Windows) script in the <jboss_install_directory>/bin directory (on Unix or Windows).
- 2. If the Service stopped properly, you will see the following three lines as the last output in the
```
[Server] Shutdown complete
Halting VM
```

4.2. Running Restcomm Signaling Gateway

4.2.1. Start the Gateway

Procedure: Start the Restcomm Signaling Gateway on

1. Change the working directory to the installation directory (the one into which the zip file's contents was extracted to)

downloads]\$ cd restcomm-jss7-<version>/ss7/restcomm-ss7-sgw

2. (Optional) Ensure that the *bin/run.sh* start script is executable.

restcomm-ss7-sgw\$ chmod +x bin/run.sh

3. Execute the *run.sh* Bourne shell script.

```
restcomm-ss7-sgw$ ./bin/run.sh
```

4. In the Linux terminal, the Restcomm Signaling Gateway has started successfully if the last line of output is similar to the following

15:51:18,247 INFO [MainDeployer] [[[[[[[Mobicents Signaling Gateway: release.version= Started]]]]]]]]

Procedure: Start the Restcomm Signaling Gateway on

- 1. Using Windows Explorer, navigate to the *restcomm-jss7-<version>/ss7/restcomm-ss7-sgw/bin* subfolder in the installation directory.
- 2. The preferred way to start the Restcomm Signaling Gateway is from the Command Prompt. The command line interface displays details of the startup process, including any problems encountered during the startup process.

Open the Command Prompt via the Start menu and navigate to the correct folder:

C:\Users\<user>\My Downloads>cd "restcomm-jss7-<version>\ss7{this-folder}-ss7-sgw"

3. Start the Gateway by executing the *run.bat* file:

• run.bat batch file:

C:\Users\<user>\My Downloads\mms-standalone<version>>bin\run.bat

4.2.2. Stop the Gateway

The only option to stop the gateway is by pressing Ctrl c and bringing down the JVM or killing the process.

4.2.3. Bind the Gateway to IP

Using run.sh without any arguments binds the gateway to 127.0.0.1. To bind the Gateway to a different IP, pass the IP address as value to the -b command line option. For example to bind the server to 115.252.103.220 you will use the command as below:

restcomm-ss7-sgw\$./bin/run.sh -b 115.252.103.220

4.3. Running jSS7 as a Standalone library

If you do not wish to use the JBoss Container and do not require JSLEE RAs you can configure and run the Stack as a Standalone library. For more details, refer to Configuring as a Standalone library

4.4. Running the Shell `Shell `

4.4.1. Start the Shell Client

Shell client can be started with following command from *\$JBOSS_HOME/bin* :

```
[$] ./ss7-cli.sh
```

Once console starts, it will print following like information:

```
-----
```

Mobicents SS7 Management Shell Bootstrap Environment

```
-----
```

mobicents>

The ss7-cli script supports the following options

Usage: SS7 [OPTIONS] Valid Options -v Display version number and exit -h This help screen

4.4.2. Connect to Managed Instance

Shell needs to connect to managed instance. Command to connect has following structure:

```
connect <IP> <PORT>
```

Example 1. Connect to remote machine

mobicents>connect 10.65.208.215 3435

mobicents(10.65.208.215:3435)>

Host IP and port are optional, if not specified, shell will try to connect to 127.0.0.1:3435

4.4.3. Disconnect

Command to disconnect has following structure:

ss7 discconnect

Example 2. Disconnect

mobicents(10.65.208.215:3435)>ss7 disconnect

Bye mobicents>

4.4.4. Authentication and Audit Logs

4.4.4.1. Security

Security is a fundamental requirement of any Telecom application. You must control access to your SS7 network and restrict who is allowed to access what and perform what operations.

Restcomm jSS7 CLI Security is based on the JBoss Security Framework. The JBoss Security framework provides support for a role-based declarative security model as well as integration of

custom security via a security proxy layer. The default implementation of the declarative security model is based on Java Authentication and Authorization Service (JAAS) login modules and subjects.

Procedure: Enable Security

1. Add a new parameter named "securityDomain" to the "ShellExecutor" bean in the configuration file *jboss-5.1.0.GA/server/default/deploy/restcomm-ss7-service/META-INF/jboss-beans.xml* and save the changes.

<property name="securityDomain">java:/jaas/jmx-console</property>

- 2. Configure the security domain in the file *jboss-5.1.0.GA/server/default/conf/login-config.xml* following the instructions in the JBoss Admin Guide.
- 3. Create entries for user id and password in the file [path]_ jboss-5.1.0.GA/server/default/conf/props/jmx-console-users.properties_ for every user allowed to access the CLI.

Procedure: Disable Security

1. Delete all configurations created as mentioned above and remove the parameter "securityDomain" from the "Shell Executor" bean defined in *jboss-5.1.0.GA/server/default/deploy/restcomm-ss7-service/META-INF/jboss-beans.xml*.

If you would like to read more about the JBoss Security Framework, please refer to the JBoss Admin Guide available in their website.

4.4.4.2. Audit Configuration

If security is enabled then you can log the operations performed by every user.

Procedure: Enable Audit

1. Add a new appender to the file *jboss-5.1.0.GA/server/default/conf/jboss-log4j.xml* as below:

2. Add a new category to the file *jboss-5.1.0.GA/server/default/conf/jboss-log4j.xml* as below:

```
<category name="org.jboss.security.audit.providers.LogAuditProvider"
additivity="false">
        <priority value="TRACE"/>
        <appender-ref ref="AUDIT"/>
</category>
```

When security and audit is enabled, a sample audit log looks like this:

2012-11-28 22:17:27,005 TRACE [org.jboss.security.audit.providers.LogAuditProvider] (pool-19-thread-8:) [Success]message=login success;principal=admin; 2012-11-28 22:17:47,659 TRACE [org.jboss.security.audit.providers.LogAuditProvider] (pool-19-thread-1:) [Info]response=Successfully added client Association=SCTPAssoc1;principal=admin;command=sctp association create SCTPAssoc1 CLIENT 127.0.0.1 2775 127.0.0.1 2776; 2012-11-28 22:18:06,773 TRACE [org.jboss.security.audit.providers.LogAuditProvider] (pool-19-thread-3:) [Success]message=logout success;principal=admin;

4.4.5. Command-line Completion

Restcomm jSS7 Shell supports Command-line completion (Tab Completion) allowing you to type the first (or first few) character(s) of the comand and press tab to fill in the rest of the command. As soon as you enter the CLI (by executing the *ss7-cli.sh* script) you can make use of this feature to view all possible commands.

When you first enter CLI and press the "tab" key, CLI will display all operations permitted in that context. Once you connect to a managed instance and while staying connected if you press the "tab" key it will display all other commands allowed.

```
mobicents> [tab key press]
history connect exit
mobicents>connect 10.65.208.215 3435
mobicents(10.65.208.215:3435)> [tab key press]
sctp linkset m3ua sccp history disconnect
```

If you enter the first few characters of a command and press "tab", CLI will automatically fill in the rest of the command or display all possible commands if there is more than one command beginning with the characters entered by you.

mobicents(10.65.208.215:3435)>sctp [tab key press]
server association --help
mobicents(10.65.208.215:3435)>sctp

In addition, help files are also available for every command using the --help option. The help files provide details of the command including possible parameters and examples of usage if applicable.

```
mobicents(10.65.208.215:3435)>sctp --help
Name
    sctp
    Manage M3UA - SCTP
SYNOPSIS
    sctp server [create | destroy | start | stop | show] [parameters]
    sctp association [create | destroy | show] [parameters]
    parameters
        Command Line parameters.
DESCRIPTION
    This command is used to manage M3UA - SCTP. You can create, destroy, start and
    stop a SCTP Server and view the Server configuration using the sctp server
    command. You can create, destroy and view SCTP Associations using the
    sctp association command.
SEE ALSO
    sctp server create, sctp server destroy, sctp server start, sctp server stop,
    sctp server show, sctp association create, sctp association destroy,
    sctp association show
mobicents(10.65.208.215:3435)>
```

4.5. Running the Graphical User Interface

Open a Web Browser and navigate to http://localhost:8080/jss7-management-console/. The window will look similar to the figure below. The GUI is divided into three sections:

- A left panel listing the management units (Services, SCTP, M3UA, Linkset, SCCP, TCAP, Alarms, Manage Campaigns and Metrics). You can click on any of these to select and navigate to the specific management unit.
- A main panel displaying the currently selected management unit. At the top of this panel you will find a bread crumb trail providing links back to each previous page that you navigated through in order to get to the current page. The main view is categorized into multiple tabs to manage different aspects of the selected layer.
- A bottom panel displaying the log data. You can clear the log anytime by clicking on the trash icon at the top right corner of this panel. You can also minimize or maximize this panel to suit your needs.

11:49:23:256 [INFO] Telscale j557 Management Console re Figure 5. GUI - Services

Anagement Console Loc

The main window will display all the configured services and their current state (running or stopped). In the example above MAP, CAP, TCAP and ISUP are configured and running. If any of these services is not running currently, the page will indicate that service as 'Stopped'. This page only indicates the current state of a service and does not allow you to start or stop the service dynamically. You can view this screen anytime by clicking on the 'Services' link in the left panel.

You will notice bread crumbs at the top of the main panel, allowing you to return to any of the previous pages you navigated through.

4.5.1. Connect to a new Instance

You can connect to a new instance by entering the IP:Port values and the login credentials in the top left corner of the GUI. However please note that this feature is not available in this release but will be fully functional in the next release.

4.5.2. Authentication

Restcomm jSS7 GUI Management Security is based on the JBoss Security Framework. This is explained in [_security].

4.6. Running Restcomm jSS7 Simulator

The Restcomm jSS7 comes with a Simulator module that will enable you to test and understand the functionality of the Stack. You can install and run the Simulator module on any machine. In addition, you can run several instances of the Simulator from one folder and each of these instances can have it's own configuration options. Configuration options are saved into a xml configuration file.

Each running instance of the Simulator has its own name (called "host name") and the name of configuration file depends on this "host name". For example if the host name is "a1", then the name

of the configuration file will be "a1_simulator.xml". You must ensure that you provide each running Simulator instance with a unique host name in order to allow each running Simulator instance to have different configuration options.

You can run and manage the Simulator locally or remotely. For running the Simulator locally you will be using a GUI interface. If you are intending to run the Simulator remotely, then you can do so using RMI access (via a GUI interface) or a HTML interface (using a HTML Browser).

4.6.1. Running the Simulator Locally

Procedure: Launching the Simulator Locally

- 1. Pre-requisite: You must have SS7 Simulator installed locally in the machine.
- 2. Change the working directory to the bin folder in the Simulator's installation directory.

```
downloads]$ cd restcomm-jss7-<version>/ss7/restcomm-ss7-simulator/bin
```

3. (Optional) Ensure that the *run.sh* start script is executable.

```
bin$ chmod +x run.sh
```

4. Execute the *run.sh* Bourne shell script with the command ./run.sh gui. If you wish to pass the "host name" parameter (say for example "a1") you can do so by issuing the command as ./run.sh gui -nal or ./run.sh gui --name=a1 where "a1" is the "host name" of this simulator instance.

bin\$./run.sh gui --name=a1

5. Result: This will launch the GUI application form ""Connecting to a testerHost ..." as in the figure below:

Host name a1			
Create a local testerHost			
Connect to the existing testerHost via JMX			
service:jmx:rmi:///jndi/rmi://localhost:9999/server			
Start			

Figure 6. Running Simulator Locally

Procedure: Creating a Local testerHost

1. Pre-requisite: You must have the GUI application form "Connecting to a testerHost" launched by

running the simulator locally as explained in the above procedure.

- 2. In the GUI application form "Connecting to a testerHost ..." enter a value for the Host name field if it is empty.
- 3. Select the option "Create a local testerHost" and press the "Start" button.
- 4. Result: This will create a local testerHost and launch a new form **SS7 Simulator:** <**host name** > -**local** as in the figure below:

🛃 SS7 Simulator: a1	local			
Layer 1	M3UA	▼		
Layer 2	SCCP	▼		
Layer 3	TCAP+MAP	▼		
Testing task	USSD_TEST_CLIENT	▼		
Reload	Save	Run test		
Terminate remote host and exit				

Figure 7. The main form of the Simulator

Procedure: Running a Test

- 1. Pre-requisite: You must have the main Simulator form launched as explained in the above procedure.
- 2. Select required modules for Layers 1 3 and the Testing Task.
- 3. Configure the modules to meet your requirements. Click on the button "..." to the right of the selected module. When layer configuring you can press one of two buttons "Load default values for side A" and "Load default values for side B" for loading default values for testing. These default values can be used if you are using SS7 Simulators in the one computer host as the side A and the side B for interaction. To save the configured layers to the disk, click the "Save" button. To reload the saved configuration, use the "Reload" button.
- 4. When all required layers are correctly configured, click the "Run test" button.
- 5. Result: The form for testing will be displayed as in the figure below:

4	-			
L1 state	SCTP: Connected M3UA: pFsm:ACTIVE IFsmP:ACTIVE

Message received		procUnstrSsResp; Balance=10\$		
PrevDialog: Sent procUnstrSsReq="*123#";procUnstrSsResp="Balance=10\$";				

Figure 8. Example Simulator testing form

The form has three sections:

- The top section displays information regarding the Simulator layers and the state of Testing. This information is refreshed every 5 seconds automatically. You can also choose to refresh this manually by clicking the "Refresh state" button. When you click the "Start" button, all modules will start and be ready for testing. When you click the "Stop" button all modules will stop.
- The middle section of the form displays notifications from testing modules.
- The bottom section of the form holds test dependant information whose details are displayed in the corresponding test definition.

For more details on executing tests, please refer to SS7 Simulator Test Cases.

4.6.2. Running SS7 Simulator remotely

The Simulator can be run remotely using RMI and/or HTML Adaptors. But prior to launching the Simulator remotely, you must first run a tester host in the host machine as explained in the procedure below:

Procedure: Launching a Tester Host in the host machine

- 1. Pre-requisite: You must have SS7 Simulator installed locally in the host machine.
- 2. Change the working directory to the bin folder in the Simulator's installation directory.

downloads]\$ cd restcomm-jss7-<version>/ss7/restcomm-ss7-simulator/bin

3. (Optional) Ensure that the *run.sh* start script is executable.

bin\$ chmod +x run.sh

- 4. Execute the *run.sh* Bourne shell script with the command ./run.sh core -na1 -t8001 -r9999,9998 or ./run.sh core --name=a1 --http=8001 --rmi=9999,9998. You can use a rmi connector or http connector or both simultaneously. The command options are explained below:
 - "-n" (or "--name=") defines a host name (in the example above: "a1").
 - "-r" (or "--rmi=") defines a port's listening for rmi requests (in the example above: "9999 and 9998"). RMI protocol uses 2 ports for server access. The first port (9999 above) is rmi port and 9998 is second port used by RMI. Usually RMI randomly selects this 2nd port, however if the core simulator is behind firewall, the GUI will not be able to connect from remote machine without admin opening up all the ports. This can be risky, hence --rmi takes two ports as comma separated and admin can open these two ports on firewall.

Please note that fixing the 2nd port in RMI contradicts the RMI specification.

- "-t" (or "--http=") defines a port listening for html requests (in the example above: "8001").
- "-Djava.rmi.server.hostname=192.168.1.1" if remote host contains several IP addresses you need to specify by this command which exactly IP address RMI will use.

bin\$./run.sh core -na1 -t8001 -r9999,9998

or

bin\$./run.sh core --name=a1 --http=8001 --rmi=9999,9998

5. Result: This will start the Tester Host in this machine and the output displayed in the console will be as below:

When the Tester Host is running successfully in the host machine, you can now run the Simulator tests remotely from any machine which has the Simulator installed. The following procedures provide instructions to run the Simulator remotely using the two interfaces (RMI and HTML).

Procedure: Managing the Simulator Remotely using RMI Interface

- 1. Pre-Requisite: The Tester Host must be launched in the host machine as explained in the above procedure. The local machine must have the Simulator installed.
- 2. The best client for managing the Simulator via a RMI interface is the GUI interface of Simulator. It can be launched in the same way as launching a Simulator locally:

./run.sh gui

This will launch the GUI form "Connecting to a testerHost...".

Sconnecting to a testerHost			
Host name a1			
Create a local testerHost Connect to the existing testerHost via IMX			
service:jmx:rmi://jndi/rmi://192.168.10.12			
Start			

Figure 9. Launching Simulator GUI for a remote mode

- 3. In the form, select the option "Connect to the existing testerHost via JMX".
- 4. In the default RMI connection string, replace "localhost" with the correct IP address of the tester host computer and the value "9999" with the correct RMI port (the port from option "-r" or "-- rmi=" as provided when launching the testerHost in the host machine).
- 5. Once successfully connected, the management will be similar to the procedures explained for running the Simulator application locally (see Running the Simulator Locally). "Jconsole" application can be also used as the client. But this application is less convenient when compared to the easy RMI interface.

Procedure: Managing the Simulator Remotely using HTML Interface

HTML management is less convenient than RMI management. But it can be used if RMI is not acceptable (for example if you are behind a proxy). For configuring the parameters and running the tests you can use any HTML browser. In the URL field of the browser, type http://<IP address > :<port where IP address is the host machine's address and port is the value specified for "-t" or "--http=" option when launching the Tester Host in the remote machine.

Figure 10. Managing remotely with a HTML Interface

2. The web page will display all Beans. "TesterHost" is the main MBean in which you can select the mode for test working, start/stop testing (buttons "Start"/"Stop") and quit a tester host (button "quit"). You can use other Beans for setting different options for layers and test tasks.

3. The Results of the tests can be found at the console (in the server) or in the log file (file name is "a1.log" where "a1" is the name of the Simulator instance).

Chapter 5. Configuring jboss-beans.xml

5.1. Configuring Restcomm SS7 Service

Configuration is done through an XML descriptor file named *jboss-beans.xml* located at *\$JBOSS_HOME/server/profile_name/deploy/restcomm-ss7-service/META-INF*, where profile_name is the name of the server profile. Default *jboss-beans.xml* contains only m3ua usage. Templates for usage of Dialogic boards or m3ua and Dialogic boards together can be found in the release binaries in folders: *ss7/template/META-INF-dialogic* and *ss7/template/META-INF-m3ua-dialogic*

Restcomm SS7 Layer 4 (SCCP, ISUP) leverages either of the following MTP layers to exchange signaling messages with remote signaling points:

- M3UA
- dahdi
- dialogic

5.1.1. Configuring M3UA

You must configure M3UAManagement if the underlying SS7 service will leverage M3UA. For more details on configuring M3UAManagement, please refer to M3UA Management.

Scroll down to the section for M3UA Layer in the *jboss-beans.xml* file and define the properties to suit your requirements.

```
<!-- SCTP Properties
                                                                        -->
      <!-- Used by M3UA layer
                                                                       -->
      <bean name="SCTPManagement"</pre>
class="org.mobicents.protocols.sctp.netty.NettySctpManagementImpl">
             <constructor>
                     <parameter>SCTPManagement</parameter>
             </constructor>
             <property name="persistDir">${jboss.server.data.dir}</property>
      </bean>
      <bean name="SCTPShellExecutor"</pre>
             class="org.mobicents.protocols.ss7.m3ua.impl.oam.SCTPShellExecutor">

       </bean>
       <bean name="M3UAShellExecutor"</pre>
               class="org.mobicents.protocols.ss7.m3ua.impl.oam.M3UAShellExecutor">
           <property name="m3uaManagements"></property name="m3uaManagements">
               <map keyClass="java.lang.String"
valueClass="org.mobicents.protocols.ss7.m3ua.impl.M3UAManagementImpl">
                  <entry>
                      <key>Mtp3UserPart</key>
                      <value>
                          <inject bean="Mtp3UserPart" />
                      </value>
                  </entry>
               </map>
           </property>
       </bean>
```

org.mobicents.protocols.sctp.netty.NettySctpManagementImpl

This SCTP Management Bean takes a String as a constructor argument. The name is prepended to the name of the XML file created by the SCTP stack for persisting the state of SCTP resources. This XML file is stored in the path specified by the property persistDir. For example, in the above case, when Restcomm SS7 Service is started, a file named *SCTPManagement_sctp.xml* will be created at *\$JBOSS_HOME/server/profile_name/data* directory. The other properties of the Stack are defined below:

org.mobicents.protocols.ss7.m3ua.impl.M3UAManagementImpl

This M3UA Management Bean takes a String as a first constructor argument. The name is prepended to the name of the XML file created by the M3UA stack for persisting the state of M3UA resources. The second constructor argument of M3UA Management Bean is also a String. This is a productName parameter.

This XML file is stored in the path specified by the property persistDir. For example, in the above case, when Restcomm SS7 Service is started, a file named *Mtp3UserPart_m3ua1.xml* will be created at *\$JBOSS_HOME/server/profile_name/data* directory. The other properties of the Stack are defined below:

persistDir

As explained above

routingLabelFormat

The routing label format supported by this network. See Configuring MTP3 routing label for further details.

transportManagement

SCTPManagement mbean should be provided here.

other parameters

See M3UA stack properties

5.1.2. Configuring dahdi

Dahdi based MTP layer will only be used if you have installed dahdi based SS7 hardware (Sangoma or Diguim) cards. DahdiLinksetFactory is responsible for creating new instances of DahdiLinkset when instructed by the LinksetManager.

The corresponding native libraries for dahdi (libmobicents-dahdi-linux library) must be compiled before stack configuring and put into \$JBOSS_HOME/bin/META-INF/lib/linux2/x86 if OS is 32 bit or \$JBOSS_HOME/bin/META-INF/lib/linux2/x64 if OS and JAVA is 64 bit.

See JSS7 Installation Guide for more details.

Libraries are compiled only for linux OS for 32-bit JAVA for now.

```
<bean name="DahdiLinksetFactory"
class="org.mobicents.ss7.hardware.dahdi.oam.DahdiLinksetFactory">
    </bean>
```

LinksetFactoryFactory is just a call-back class listening for new factories deployed. It maintains a Map of available 'factory name' vs 'factory'. You should never touch this bean.

LinksetManager is responsible for managing Linkset and Link.

```
<!-- Linkset manager Service
                                                     -->
   <bean name="LinksetFactoryFactory"</pre>
class="org.mobicents.ss7.linkset.oam.LinksetFactoryFactory">
           <incallback method="addFactory" />
           <uncallback method="removeFactory" />
   </bean>
   <bean name="DahdiLinksetFactory"</pre>
class="org.mobicents.ss7.hardware.dahdi.oam.DahdiLinksetFactory">
   </hean>
   <bean name="LinksetManager"</pre>
class="org.mobicents.ss7.linkset.oam.LinksetManagerImpl">
       <constructor>
           <parameter>LinksetManager</parameter>
       </constructor>
       <property name="scheduler">
           <inject bean="SS7Scheduler" />
       </property>
       <property name="linksetFactoryFactory">
           <inject bean="LinksetFactoryFactory" />
       </property>
       <property name="persistDir">${jboss.server.data.dir}</property>
   </bean>
   <bean name="LinksetExecutor" class=</pre>
"org.mobicents.ss7.linkset.oam.LinksetExecutor">
       <property name="linksetManager">
           <inject bean="LinksetManager" />
       </property>
   </bean>
```

When LinksetManagerImpl is started it looks for the file *linksetmanager.xml* containing serialized information about underlying linksets and links. The directory path is configurable by changing the value of the property persistDir.

linksetmanager.xml should never be edited by you manually. Always use the Shell Client to connect to the Stack and execute appropriate commands.

LinksetExecutor accepts the linkset commands and executes necessary operations.

5.1.3. Configuring dialogic

Dialogic based MTP layer will only be used if you have installed Dialogic cards. DialogicMtp3UserPart communicates with Dialogic hardware. It is assumed here that MTP3 and MTP2 is leveraged from the Dialogic Stack either on-board or on-host.

The corresponding native libraries for dialogic (native lib libgctjni.so and gctApi library gctApi.jar) should be downloaded from the Dialogic site and copied : * libgctjni.so - to the folder \$JBOSS_HOME/bin/META-INF/lib/linux2/x86 if OS is 32 bit or \$JBOSS_HOME/bin/META-INF/lib/linux2/x64 if OS and JAVA is 64 bit. * gctApi.jar - to the folder jboss-5.1.0.GA/server/default/deploy/Restcomm-ss7-service/lib

See JSS7 Installation Guide for more details.

This Dialogic Bean takes a String as a first constructor argument. This is a productName parameter.

The other properties of the Stack are defined below:

sourceModuleId

sourceModuleId is the id of source module and should match with the value configured in the file *system.txt* used by **dialogic** drivers. In the above example, 61 is assigned for mobicents process.

destinationModuleId

destinationModuleId is the id of destination module. In the above example, 34 is the id of Dialogic MTP3 module.

routingLabelFormat

The routing label format supported by this network. See Configuring MTP3 routing label for further details.

5.1.4. Configuring MTP3 routing label

MTP Level 3 routes messages based on the routing label in the signaling information field (SIF) of message signal units. The routing label is comprised of the destination point code (DPC), originating point code (OPC), and signaling link selection (SLS) field. Overtime different standards cameup with different routing label format. For example An ANSI routing label uses 7 octets; an ITU-T routing label uses 4 octets.

Restcomm jSS7 is flexible to configure the routing label as shown below.

Following table shows various routing formats supported

Table 3. Routing Format

Name	point code length	sls length
ITU	14-bits	4-bits
ANSI_Sls8Bit	24-bits	8-bits
ANSI_Sls5Bit	24-bits	5-bits
Japan_TTC_DDI	not supported yet	not supported yet
Japan_NTT	not supported yet	not supported yet
China	not supported yet	not supported yet

5.1.5. Configuring SCCP

As name suggests SccpStack initiates the SCCP stack routines.

```
<!-- SCCP Service -->
   <bean name="SccpStack" class=</pre>
"org.mobicents.protocols.ss7.sccp.impl.SccpStackImpl">
       <constructor>
           <parameter>SccpStack</parameter>
       </constructor>
       <property name="persistDir">${jboss.server.data.dir}</property>
       <property name="mtp3UserParts"></property name="mtp3UserParts">
           <map keyClass="java.lang.Integer"
valueClass="org.mobicents.protocols.ss7.mtp.Mtp3UserPart">
              <entry>
                  <key>1</key>
                      <value>
                             <inject bean="Mtp3UserPart" />
                      </value>
              </entry>
           </map>
       </property>
   </bean>
   <bean name="SccpExecutor"</pre>
class="org.mobicents.protocols.ss7.sccp.impl.oam.SccpExecutor">
       <property name="sccpStacks"></pro>
           <map keyClass="java.lang.String"
valueClass="org.mobicents.protocols.ss7.sccp.impl.SccpStackImpl">
              <entry>
                  <key>SccpStack</key>
                  <value>
                      <inject bean="SccpStack" />
                  </value>
              </entry>
           </map>
       </property>
   </bean>
```

org.mobicents.protocols.ss7.sccp.impl.SccpStackImpl takes String as constructor argument. The name is prepend to xml file created by SCCP stack for persisting state of SCCP resources. The xml is stored in path specified by persistDir property above.

For example in above case, when Restcomm SS7 Service is started 3 file's *SccpStack_management2.xml*, *SccpStack_sccpresource2.xml* and *SccpStack_sccprouter2.xml* will be created at *\$JBOSS_HOME/server/profile_name/data* directory

Stack has following properties:

persistDir

As explained above

mtp3UserParts

specifies SS7 Level 3 to be used as transport medium(be it SS7 card or M3UA). Restcomm jSS7 SCCP allows configuring multiple MTP3 layers for same SCCP stack. This allows to have multiple local point-code and connecting to various networks while SCCP layer remains same

SccpExecutor accepts sccp commands and executes necessary operations

5.1.6. Configuring TCAP

TcapStack initiates the TCAP stack routines. Respective TCAP stack beans are instantiated for each MAP, CAP Service. If you are using either one, feel free to delete the other.

```
<!-- TCAP Service -->
<bean name="TcapStackMap" class="org.mobicents.protocols.ss7.tcap.TCAPStackImpl">
   <constructor>
       <parameter>TcapStackMap</parameter>
       <parameter>
           <inject bean="SccpStack" property="sccpProvider" />
       </parameter>
       <parameter>8</parameter>
   </constructor>
   <property name="persistDir">${jboss.server.data.dir}</property>
   <property name="previewMode">false</property></property>
</bean>
<bean name="TcapStackCap" class="org.mobicents.protocols.ss7.tcap.TCAPStackImpl">
   <constructor>
       <parameter>TcapStackCap</parameter>
           <parameter>
              <inject bean="SccpStack" property="sccpProvider" />
           </parameter>
           <parameter>146</parameter>
       </constructor>
   <property name="persistDir">${jboss.server.data.dir}</property>
   <property name="previewMode">false</property></property>
</bean>
<bean name="TcapStack" class="org.mobicents.protocols.ss7.tcap.TCAPStackImpl">
   <constructor>
       <parameter>TcapStack</parameter>
       <parameter>
           <inject bean="SccpStack" property="sccpProvider" />
       </parameter>
       <parameter>9</parameter>
   </constructor>
   <property name="persistDir">${jboss.server.data.dir}</property>
   <property name="previewMode">false</property></property>
</bean>
```

```
<bean name="TcapExecutor"</pre>
class="org.mobicents.protocols.ss7.tcap.oam.TCAPExecutor">
        <property name="tcapStacks"></pro>
            <map keyClass="java.lang.String"
valueClass="org.mobicents.protocols.ss7.tcap.TCAPStackImpl">
                <entry>
                     <key>TcapStackMap</key>
                     <value>
                         <inject bean="TcapStackMap" />
                     </value>
                </entry>
                <entry>
                     <key>TcapStackCap</key>
                     <value>
                         <inject bean="TcapStackCap" />
                     </value>
                </entry>
                <entry>
                     <key>TcapStack</key>
                     <value>
                         <inject bean="TcapStack" />
                     </value>
                </entry>
            </map>
        </property>
    </bean>
```

org.mobicents.protocols.ss7.tcap.TCAPStackImpl takes String as a first constructor argument. The name is prepend to xml file created by TCAP stack for persisting state of TCAP resources. The xml is stored in path specified by persistDir property above.

For example in above case, when Restcomm SS7 Service is started file's 3 TcapStack_management.xml, TcapStack_managementMap.xml and TcapStack_managementCap.xml *\$]BOSS_HOME/server/profile_name/data* will be created at directory. Then org.mobicents.protocols.ss7.tcap.TCAPStackImpl takes SccpStack as second constructor argument. TCAP uses passed SCCP stack. Constructor also takes the sub system number (SSN) which is registered with passed SCCP stack (this is the third parameter).

TCAP Stack has following configurable properties:

persistDir

As explained above

previewMode: public void setPreviewMode(boolean val);

PreviewMode is needed for special processing mode. By default TCAP is not set in PreviewMode. When PreviewMode set in TCAP level:

• Stack only listens for incoming messages and does not send anything. The methods send(), close(), sendComponent() and other such methods do nothing.

- A TCAP Dialog is temporary. TCAP Dialog is discarded after any incoming message like TC-BEGIN or TC-CONTINUE has been processed.
- For any incoming messages (including TC-CONTINUE, TC-END, TC-ABORT) a new TCAP Dialog is created (and then deleted).
- There are no timers and timeouts.

TcapExecutor accepts tcap commands and executes necessary operations

5.1.7. Configuring ShellExecutor

ShellExecutor is responsible for listening incoming commands. Received commands are executed on local resources to perform actions like creation and management of TCAP, SCCP, SCTP and M3UA stack.

```
<!-- Shell Service -->
   <!-- Define Shell Executor -->
   <bean name="ShellExecutor"</pre>
class="com.mobicents.ss7.management.console.ShellServer">
      <constructor>
          <parameter>
             <inject bean="SS7Scheduler" />
          </parameter>
          <parameter>
             <list class="javolution.util.FastList"
elementClass="org.mobicents.ss7.management.console.ShellExecutor">
                 <inject bean="SccpExecutor" />
                 <inject bean="M3UAShellExecutor" />
                 <inject bean="SCTPShellExecutor" />
                 <inject bean="TcapExecutor" />
                 <!-- <inject bean="LinksetExecutor" /> -->
             </list>
          </parameter>
      </constructor>
      <property name="address">${jboss.bind.address}</property></property>
      <property name="port">3435</property></pro>
      <property name="securityDomain">java:/jaas/jmx-console</property>
   </bean>
```

By default ShellExecutor listens at jboss.bind.address and port 3435. (This is used when you use CLI access after running of ss7-cli command). You may set the address property to any valid IP address that your host is assigned. The shell commands are exchanged over TCP/IP.

To understand JBoss bind options look at Installation_And_Getting_Started_Guide

SCTPShellExecutor and M3UAShellExecutor is declared only if MTP layer M3UA is used. If dialogic MTP

layer is used these beans are not decalred and should be removed from FastList too. For dahdi need to declare LinksetExecutor bean and add in FastList above.

5.1.8. Configuring MAP

MapStack initiates the MAP stack routines.

org.mobicents.protocols.ss7.tcap.MAPStackImpl takes String as a first constructor argument. The name is prepend to xml file created by MAP stack for persisting state of MAP resources. The xml is stored in path specified by persistDir property above. As for now MAP stack does not store any XML files. The second constructor argument is TcapStack. MAP uses passed TCAP stack.

Feel free to delete declaration of this bean if your service is not consuming MAP messages.

5.1.9. Configuring CAP

CapStack initiates the CAP stack routines.

org.mobicents.protocols.ss7.tcap.CAPStackImpl takes String as a first constructor argument. The name is prepend to xml file created by CAP stack for persisting state of CAP resources. The xml is stored in path specified by persistDir property above. As for now CAP stack does not store any XML files. The second constructor argument is TcapStack. CAP uses passed TCAP stack.

Feel free to delete declaration of this bean if your service is not consuming CAP messages.

5.1.10. Configuring ISUP

IsupStack initiates the ISUP stack routines.

```
<!-- ISUP Service -->
   <bean name="CircuitManager"</pre>
class="org.mobicents.protocols.ss7.isup.impl.CircuitManagerImpl">
   </bean>
   <bean name="IsupStack" class=</pre>
"org.mobicents.protocols.ss7.isup.impl.ISUPStackImpl">
      <constructor>
         coarameter>
            <inject bean="SS7Scheduler" />
         </parameter>
         <parameter>22234</parameter>
         <parameter>2</parameter>
      </constructor>
      <property name="mtp3UserPart">
         <inject bean="Mtp3UserPart" />
      </property>
      <property name="circuitManager">
         <inject bean="CircuitManager" />
      </property>
   </bean>
```

org.mobicents.protocols.ss7.isup.impl.ISUPStackImpl takes SS7Scheduler, local signaling pointcode
and network indicator as constructor argument.

Stack has following properties:

mtp3UserPart

specifies SS7 Level 3 to be used as transport medium (be it SS7 card or M3UA).

circuitManager

CIC management bean

Feel free to delete declaration of this bean if your service is not consuming ISUP messages.

5.1.11. Configuring SS7Service

SS7Service acts as core engine binding all the components together.

<constructor><parameter>TCAP</parameter></constructor>

<annotation>@org.jboss.aop.microcontainer.aspects.jmx.JMX(name="org.mobicents.ss7:serv ice=TCAPSS7Service",exposedInterface=org.mobicents.ss7.SS7ServiceMBean.class,registerD irectly=true)

```
</annotation>
        <property name="jndiName">java:/restcomm/ss7/tcap</property>
        <property name="stack"></property name="stack">
            <inject bean="TcapStack" property="provider" />
        </property>
    </bean>
    <bean name="MAPSS7Service" class="org.mobicents.ss7.SS7Service">
        <constructor><parameter>MAP</parameter></constructor>
<annotation>@org.jboss.aop.microcontainer.aspects.jmx.JMX(name="org.mobicents.ss7:serv
ice=MAPSS7Service",exposedInterface=org.mobicents.ss7.SS7ServiceMBean.class,registerDi
rectly=true)
        </annotation>
        <property name="jndiName">java:/restcomm/ss7/map</property>
        <property name="stack"></property name="stack">
            <inject bean="MapStack" property="MAPProvider" />
        </property>
    </bean>
    <bean name="CAPSS7Service" class="org.mobicents.ss7.SS7Service">
        <constructor><parameter>CAP</parameter></constructor>
<annotation>@org.jboss.aop.microcontainer.aspects.jmx.JMX(name="org.mobicents.ss7:serv
ice=CAPSS7Service",exposedInterface=org.mobicents.ss7.SS7ServiceMBean.class,registerDi
rectly=true)
        </annotation>
```

```
<constructor><parameter>ISUP</parameter></constructor>
```

TCAPSS7Service binds TcapStack to JNDI java:/restcomm/ss7/tcap.

MAPSS7Service binds MapStack to JNDI java:/restcomm/ss7/map.

CAPSS7Service binds CapStack to JNDI java:/restcomm/ss7/cap.

ISUPSS7Service binds IsupStack to JNDI java:/restcomm/ss7/isup.

The JNDI name can be configured to any valid JNDI name specific to your application.

Feel free to delete service that your application is not using.

5.1.12. Configuring jSS7 Management Service

jSS7 Managemenet Service provides some extra functionality for stack management including jmx access to stacks, performance (statistics) and alarm management.

```
<bean name="Ss7Management"</pre>
        class="org.mobicents.protocols.ss7.oam.common.jmxss7.Ss7Management">
<annotation>@org.jboss.aop.microcontainer.aspects.jmx.JMX(name="org.mobicents.ss7:serv
ice=Ss7Management",exposedInterface=org.mobicents.protocols.ss7.oam.common.jmxss7.Ss7M
anagementMBean.class,registerDirectly=true)</annotation>
        <property name="agentId">jboss</property></property>
    </bean>
    <bean name="RestcommAlarmManagement"</pre>
        class="org.mobicents.protocols.ss7.oam.common.alarm.AlarmProvider">
        <constructor>
            <parameter>
                <inject bean="Ss7Management" />
            </parameter>
            <parameter>
                <inject bean="Ss7Management" />
            </parameter>
        </constructor>
    </bean>
    <bean name="RestcommStatisticManagement"</pre>
class="org.mobicents.protocols.ss7.oam.common.statistics.CounterProviderManagement">
        <constructor>
            <parameter>
                <inject bean="Ss7Management" />
            </parameter>
        </constructor>
        <property name="persistDir">${jboss.server.data.dir}</property>
    </bean>
    <bean name="RestcommSctpManagement"</pre>
        class="org.mobicents.protocols.ss7.oam.common.sctp.SctpManagementJmx">
        <constructor>
            <parameter>
                <inject bean="Ss7Management" />
```

```
</parameter>
        <parameter>
            <inject bean="SCTPManagement" />
        </parameter>
    </constructor>
</bean>
<bean name="RestcommM3uaManagement"</pre>
    class="org.mobicents.protocols.ss7.oam.common.m3ua.M3uaManagementJmx">
    <constructor>
        <parameter>
            <inject bean="Ss7Management" />
        </parameter>
        <parameter>
            <inject bean="Mtp3UserPart" />
        </parameter>
    </constructor>
</bean>
<bean name="RestcommSccpManagement"</pre>
    class="org.mobicents.protocols.ss7.oam.common.sccp.SccpManagementJmx">
    <constructor>
        <parameter>
            <inject bean="Ss7Management" />
        </parameter>
        <parameter>
            <inject bean="SccpStack" />
        </parameter>
    </constructor>
</bean>
<bean name="RestcommTcapManagement"</pre>
    class="org.mobicents.protocols.ss7.oam.common.tcap.TcapManagementJmx">
    <constructor>
        <parameter>
            <inject bean="Ss7Management" />
        </parameter>
        <parameter>
            <inject bean="TcapStack" />
        </parameter>
    </constructor>
</bean>
<bean name="RestcommTcapMapManagement"</pre>
    class="org.mobicents.protocols.ss7.oam.common.tcap.TcapManagementJmx">
    <constructor>
        <parameter>
            <inject bean="Ss7Management" />
        </parameter>
        <parameter>
            <inject bean="TcapStackMap" />
```

```
</parameter>
        </constructor>
    </bean>
    <bean name="RestcommTcapCapManagement"</pre>
        class="org.mobicents.protocols.ss7.oam.common.tcap.TcapManagementJmx">
        <constructor>
            <parameter>
                <inject bean="Ss7Management" />
            </parameter>
            <parameter>
                <inject bean="TcapStackCap" />
            </parameter>
        </constructor>
    </bean>
<!--
    <bean name="RestcommLinksetManagement"</pre>
        class="org.mobicents.protocols.ss7.oam.common.linkset.LinksetManagerJmx">
        <constructor>
            <parameter>
                <inject bean="Ss7Management" />
            </parameter>
            <parameter>
                <inject bean="LinksetManager" />
            </parameter>
        </constructor>
    </bean>
-->
```

5.2. Configuring Restcomm Signaling Gateway

Configuration is done through an XML descriptor named *sgw-beans.xml* and is located at *restcomm-ss7-sgw/deploy*

Before Restcomm Signaling Gateway is configured the corresponding native libraries for dahdi or dialogic should be copied to restcomm-ss7-sgw/native/32 or restcomm-ss7-sgw/native/64 folders and gctApi library to restcomm-ss7-sgw/lib folder. See more details for where to get native libraries in Configuring dahdi and Configuring dialogic.

5.2.1. Configuring M3UA (Signaling Gateway)

SGW will expose the SS7 signals received from legacy network to IP network over M3UA

```
<bean name="SCTPManagement" class="org.mobicents.protocols.sctp.ManagementImpl">
        <constructor>
             <parameter>SCTPManagement</parameter>
        </constructor>
        <property name="persistDir">${sgw.home.dir}/ss7</property>
    </bean>
    <bean name="SCTPShellExecutor"</pre>
class="org.mobicents.protocols.ss7.m3ua.impl.oam.SCTPShellExecutor">
        <property name="sctpManagements"></property name="sctpManagements">
             <map keyClass="java.lang.String"
valueClass="org.mobicents.protocols.sctp.ManagementImpl">
                 <entry>
                     <key>SCTPManagement</key>
                     <value>
                          <inject bean="SCTPManagement" />
                     </value>
                 </entry>
             </map>
        </property>
    </bean>
    <bean name="Mtp3UserPart"</pre>
class="org.mobicents.protocols.ss7.m3ua.impl.M3UAManagementImpl">
        <constructor>
             <parameter>Mtp3UserPart</parameter>
             <parameter>Restcomm-jSS7</parameter>
        </constructor>
        <property name="persistDir">${sqw.home.dir}/ss7</property>
        <property name="transportManagement">
             <inject bean="SCTPManagement" />
        </property>
    </bean>
    <bean name="M3UAShellExecutor"</pre>
class="org.mobicents.protocols.ss7.m3ua.impl.oam.M3UAShellExecutor">
        <property name="m3uaManagements"></property name="m3uaManagements">
             <map keyClass="java.lang.String"
valueClass="org.mobicents.protocols.ss7.m3ua.impl.M3UAManagementImpl">
                 <entry>
                     <key>Mtp3UserPart</key>
                     <value>
                          <inject bean="Mtp3UserPart" />
                     </value>
                 </entry>
             </map>
        </property>
    </bean>
```

5.2.2. Configuring LinksetFactory

Concrete implementation of LinksetFactory is responsible to create new instances of corresponding Linkset when instructed by LinksetManager. Restcomm Signaling Gateway defines two linkset factories :

DahdiLinksetFactory

```
<bean name="DahdiLinksetFactory"
    class="org.mobicents.ss7.hardware.dahdi.oam.DahdiLinksetFactory">
        class="org.mobicents.ss7.hardware.dahdi.oam.DahdiLinksetFactory">
        class="org.mobicents.ss7.hardware.dahdi.oam.DahdiLinksetFactory">
        class="org.mobicents.ss7.hardware.dahdi.oam.DahdiLinksetFactory">
        class="org.mobicents.ss7.hardware.dahdi.oam.DahdiLinksetFactory">
        class="org.mobicents.ss7.hardware.dahdi.oam.DahdiLinksetFactory">
        class="org.mobicents.ss7.hardware.dahdi.oam.DahdiLinksetFactory">
        c/property name="scheduler">
        c/property>
    c/property>
```

DialogicLinksetFactory

```
<bean name="DialogicLinksetFactory"
    class="org.mobicents.ss7.hardware.dialogic.oam.DialogicLinksetFactory">
    </bean>
```

Its highly unlikely that you would require both the factories on same gateway. If you have dahdi based SS7 card installed, keep DahdiLinksetFactory and remove other. If you have dialogic based SS7 card installed, keep DialogicLinksetFactory and remove other.

LinksetFactoryFactory is just a call-back class listening for new factories deployed and maintains Map of available factory name vs factory. You should never touch this bean.

5.2.3. Configuring LinksetManager

LinksetManager is responsible for managing Linkset and Link.

```
<!-- Linkset manager Service
   <bean name="LinksetManager"</pre>
class="org.mobicents.ss7.linkset.oam.LinksetManagerImpl">
       <constructor>
          <parameter>LinksetManager</parameter>
       </constructor>
       <property name="scheduler"></property name="scheduler">
          <inject bean="Scheduler" />
       </property>
       <property name="linksetFactoryFactory">
          <inject bean="LinksetFactoryFactory" />
       </property>
       <property name="persistDir">${sgw.home.dir}/ss7</property>
   </bean>
   <bean name="LinksetExecutor" class=</pre>
"org.mobicents.ss7.linkset.oam.LinksetExecutor">
       <property name="linksetManager"></pro>
          <inject bean="LinksetManager" />
       </property>
   </bean>
```

LinksetManagerImpl when started looks for file *linksetmanager.xml* containing serialized information about underlying linksets and links. The directory path is configurable by changing value of persistDir property.

linksetmanager.xml should never be edited by hand. Always use Shell Client to connect to Restcomm Signaling Gateway and execute commands.

LinksetExecutor accepts the linkset commands and executes necessary operations.

5.2.4. Configuring ShellExecutor

ShellExecutor is responsible for listening to incoming command. Received commands are executed on local resources to perform actions like creation and management of Linkset, management of M3UA stack.

-->

```
<!-- Shell Service
   <bean name="ShellExecutor"</pre>
class="org.mobicents.ss7.management.console.ShellServer">
      <constructor>
          <parameter>
             <inject bean="Scheduler" />
          </parameter>
          <parameter>
             <list class="javolution.util.FastList"
elementClass="org.mobicents.ss7.management.console.ShellExecutor">
                 <inject bean="M3UAShellExecutor" />
                 <inject bean="SCTPShellExecutor" />
                 <inject bean="LinksetExecutor" />
             </list>
          </parameter>
      </constructor>
      <property name="address">${sqw.bind.address}</property>
      <property name="port">3435</property></property>
   </bean>
```

By default ShellExecutor listens at sgw.bind.address and port 3435. You may set the address property to any valid IP address that your host is assigned. The shell commands are exchanged over TCP/IP.

-->

5.2.5. Configuring SignalingGateway

SignalingGateway acts as core engine binding all the components together.

The NodalInterworkingFunction sits between the SS7 network and IP network and routes messages to/from both the MTP3 and the M3UA layer, based on the SS7 DPC or DPC/SI address information

Chapter 6. Configuring as a Standalone library

If you intend to use the Stack as a standalone library without using JBoss Application Server or JSLEE RAs, then you must manually build each of the protocols, configure them individually, and bind them together.

6.1. Building SCTP

This is an example of a typical SCTP startup procedure, in one line of code, using automatic configuration file detection:

```
org.mobicents.protocols.api.Management sctpManagement = null;
sctpManagement = new org.mobicents.protocols.sctp.ManagementImpl("Client");
sctpManagement.setPersistDir("<your directory path>");
sctpManagement.start();
sctpManagement.setConnectDelay(10000);
```

How did jSS7 know where the configuration file was located and which one to load?

When sctpManagement.start() is called, jSS7 searches for a file named *Client sctp.xml* in the directory path set by user by calling sctpManagement.setPersistDir("<your directory path>"). For example in case linux something like of you can pass this.sctpManagement.setPersistDir("/home/abhayani/workarea/mobicents/git/jss7/master/map/load/c lient"). If directory path is not set, Management searches for system property sctp.persist.dir to get the path for directory. Even if sctp.persist.dir system property is not set, Management will look at System set property user.dir.

Once you know SCTP layer is configured and started, you can set Stack level parameters like connectionDelay by calling setters like: sctpManagement.setConnectDelay(10000);

Next step is adding of the Association and/or Server depending on whether this setup will be acting as client or server or both. Normally a configured set of Association and/or Server are stored in the xml config file and this way is recommended. But if you want to remove all previously configured Associations and Servers you need to call this command (after a Stack start).

sctpManagement.removeAllResourses();

Before adding server side association the server should also be defined and started as below:
```
boolean acceptAnonymousConnections = false;
int maxConcurrentConnectionsCount = 0; // for AnonymousConnections, 0 means
unlimited
String[] extraHostAddresses = null; // for multi-homing
IpChannelType ipChannelType = IpChannelType.SCTP;
sctpManagement.addServer(SERVER_NAME, SERVER_IP, SERVER_PORT, ipChannelType,
acceptAnonymousConnections, maxConcurrentConnectionsCount, extraHostAddresses);
sctpManagement.addServerAssociation(PEER_IP, PEER_PORT, SERVER_NAME,
SERVER_ASSOCIATION_NAME, ipChannelType);
sctpManagement.startServer(SERVER_NAME);
```

For Client side association the code is the following:

```
String[] extraHostAddresses = null; // for multi-homing
IpChannelType ipChannelType = IpChannelType.SCTP;
```

```
sctpManagement.addAssociation(HOST_IP, HOST_PORT, PEER_IP, PEER_PORT,
CLIENT_ASSOCIATION_NAME, ipChannelType, extraHostAddresses);
```

You should never start the Association programatically. Association will be started automatically when layer above M3UA's ASP is started.

This completes the SCTP configuration and start-up.

6.2. Building M3UA

Configuring the M3UA layer is similar to the steps followed for SCTP.

```
org.mobicents.protocols.ss7.m3ua.impl clientM3UAMgmt = null;
clientM3UAMgmt = new M3UAManagement("Client", null);
clientM3UAMgmt.setPersistDir("<your directory path>");
clientM3UAMgmt.setTransportManagement(sctpManagement);
```

clientM3UAMgmt.setDeliveryMessageThreadCount(DELIVERY_TRANSFER_MESSAGE_THREAD_COUNT);

```
clientM3UAMgmt.start();
```

For M3UA, it should know which underlying SCTP layer to use clientM3UAMgmt.setTransportManagement(sctpManagement);.

Once M3UA is configured and started, next step is to add the As, Asp and routing rules for M3UA. Configured set of As, Asp and routing rules is trored in *Client_m3ua1.xml* (in "your directory path" folder). But if you want to remove all previously configured As, Asp and routing rules you need to call this command (after a Stack start).

clientM3UAMgmt.removeAllResourses();

A set of As, Asp and routing rules depends on whether stack acts as Application Server side or Signaling Gateway side or just peer-to-peer (IPSP) client/server side. Below is an example of IPSP peer acting as client.

```
ParameterFactoryImpl factory = new ParameterFactoryImpl();

// Step 1 : Create App Server

RoutingContext rc = factory.createRoutingContext(new long[] { 1001 });

TrafficModeType trafficModeType =

factory.createTrafficModeType(TrafficModeType.Loadshare);

As as = clientM3UAMgmt.createAs("AS1", Functionality.AS, ExchangeType.SE,

IPSPType.CLIENT, rc, trafficModeType, 1, null);

// Step 2 : Create ASP

AspFactory aspFactor = clientM3UAMgmt.createAspFactory("ASP1",

CLIENT_ASSOCIATION_NAME);

// Step3 : Assign ASP to AS

Asp asp = clientM3UAMgmt.assignAspToAs("AS1", "ASP1");

// Step 4: Add Route. Remote point code is 2

clientM3UAMgmt.addRoute(SERVET_SPC, -1, -1, "AS1");
```

This completes the M3UA configuration and start-up. Once M3UA is configured depending on whether you are trying to build voice application that depends on ISUP or advanced network features such as those offered by supplementary services that depends on MAP, you would configure ISUP or SCCP

6.3. Building SCCP

Configuring the SCCP layer follows exactly same architecture of persisting configuration in xml file.

```
org.mobicents.protocols.ss7.sccp.SccpStack sccpStack = null;
sccpStack = new SccpStackImpl("MapLoadClientSccpStack");
clientM3UAMgmt.setPersistDir("<your directory path>");
sccpStack.setMtp3UserPart(1, this.clientM3UAMgmt);
sccpStack.start();
```

Before starting SCCP stack all it needs to know is underlying MTP3 layer. Above sections explained building SCTP and M3UA, however if you are using Dialogic boards or dahdi based boards (Diguim/Sangoma), you need to build and configure respective MTP3 layers depending on hardware used and set those in SCCP Stack sccpStack.setMtp3UserPart(1, this.clientM3UAMgmt).

One of the best features of jSS7 is it supports multiple MTP3 layers and hence you can have combination of many MTP3 layers (each of different or same type like M3UA, Dialogic and Dahid; all used at same time).

Once SCCP stack is started, it should be configured for local and remote signaling point-code, network indicator, remote sub system number and routing rules. For removing all previously configured resources you need to call this command (after a Stack start).

```
sccpStack.removeAllResourses();
```

Here is an example for adding resources:

```
sccpStack.getSccpResource().addRemoteSpc(0, SERVET SPC, 0, 0);
    sccpStack.getSccpResource().addRemoteSsn(0, SERVET_SPC, SSN, 0, false);
    sccpStack.getRouter().addMtp3ServiceAccessPoint(1, 1, CLIENT SPC,
NETWORK_INDICATOR, 0);
    sccpStack.getRouter().addMtp3Destination(1, 1, SERVET SPC, SERVET SPC, 0, 255,
255);
    ParameterFactoryImpl fact = new ParameterFactoryImpl();
    EncodingScheme ec = new BCDEvenEncodingScheme();
    GlobalTitle gt1 = fact.createGlobalTitle("-", 0,
org.mobicents.protocols.ss7.indicator.NumberingPlan.ISDN TELEPHONY, ec,
NatureOfAddress.INTERNATIONAL);
    GlobalTitle gt2 = fact.createGlobalTitle("-", 0,
org.mobicents.protocols.ss7.indicator.NumberingPlan.ISDN_TELEPHONY, ec,
NatureOfAddress.INTERNATIONAL);
    SccpAddress localAddress = new
SccpAddressImpl(RoutingIndicator.ROUTING BASED ON GLOBAL TITLE, gt1, CLIENT SPC, 0);
    sccpStack.getRouter().addRoutingAddress(1, localAddress);
    SccpAddress remoteAddress = new
SccpAddressImpl(RoutingIndicator.ROUTING BASED ON GLOBAL TITLE, gt2, SERVET SPC, 0);
    sccpStack.getRouter().addRoutingAddress(2, remoteAddress);
    GlobalTitle gt = fact.createGlobalTitle("*", 0,
org.mobicents.protocols.ss7.indicator.NumberingPlan.ISDN_TELEPHONY, ec,
NatureOfAddress.INTERNATIONAL);
    SccpAddress pattern = new
SccpAddressImpl(RoutingIndicator.ROUTING_BASED_ON_GLOBAL_TITLE, gt, 0, 0);
    sccpStack.getRouter().addRule(1, RuleType.SOLITARY, LoadSharingAlgorithm.Bit0,
OriginationType.REMOTE, pattern, "K", 1, -1, null, 0);
    sccpStack.getRouter().addRule(2, RuleType.SOLITARY, LoadSharingAlgorithm.Bit0,
OriginationType.LOCAL, pattern, "K", 2, -1, null, 0);
```

Once SCCP is configured and started, next step it to build TCAP layer.

6.4. Building TCAP

There is no configuration to persist in case of TCAP.

```
org.mobicents.protocols.ss7.tcap.api tcapStack = null;
tcapStack = new TCAPStackImpl("Client", this.sccpStack.getSccpProvider(), SSN);
tcapStack.start();
this.tcapStack.setDialogIdleTimeout(60000);
this.tcapStack.setMaxDialogs(MAX_DIALOGS);
```

Configuring TCAP is probably very simple as config reamins same irrespective of whether its used on client side or server side.

6.5. Building MAP

There is no configuration to persist in case of MAP; however MAP stack can take TCAPProvider from TCAPStack which is already configured for specific SSN as shown below:

mapStack = new MAPStackImpl("Client", tcapStack.getProvider());

Or it can also directly take SccpProvider and pass SSN to MAP Stack as shown below. In this case MAPStack itself creates the TCAPStack and leverages TCAPProvider:

mapStack = new MAPStackImpl("Client", sccpStack.getSccpProvider(), SSN);

Before MAPStack can be started, the Application interested in particualr MAP Service should register it-self as listener and activate that service:

```
mapProvider = mapStack.getMAPProvider();
mapProvider.addMAPDialogListener(this);
mapProvider.getMAPServiceSupplementary().addMAPServiceListener(this);
mapProvider.getMAPServiceSupplementary().acivate();
mapStack.start();
```

Below is how the Application code looks like:

public class Client extends MAPDialogListener, MAPServiceSupplementaryListener {
 //Implemet all MAPDialogListener methods here

//Implement all MAPServiceSupplementaryListener methods here

}

6.6. Common Code

All above snippet of code refers to below defined constants:

```
// MTP Details
protected final int CLIENT_SPC = 1;
protected final int SERVET_SPC = 2;
protected final int NETWORK_INDICATOR = 2;
protected final int SERVICE_INIDCATOR = 3; //SCCP
protected final int SSN = 8;
protected final String CLIENT_IP = "127.0.0.1";
protected final int CLIENT_PORT = 2345;
protected final String SERVER_IP = "127.0.0.1";
protected final int SERVER_PORT = 3434;
protected final int ROUTING_CONTEXT = 100;
protected final String SERVER_ASSOCIATION_NAME = "serverAsscoiation";
protected final String CLIENT_ASSOCIATION_NAME = "clientAsscoiation";
protected final String SERVER_NAME = "testserver";
. . . . .
. . . . .
```

Once you have completed development of your application, next thing is setting the classpath, compiling and starting application. You must set the classpath to point to restcomm-jss7-X.Y.Z/ss7/restcomm-ss7-service/lib. It has all the libraries needed to compile and start your application. Don't forget to include your compiled Application class file in classpath before starting the Application.

Chapter 7. Managing Restcomm jSS7

Restcomm jSS7 comes with a convenient user-friendly Graphical User Interface (GUI) and a Command Line Interface (CLI) that will allow you to configure, monitor and manage the Stack. While the CLI tool allows complete configuration and control of the Stack, the GUI-based management enhances the usability of the platform and gives you the ability to create different SS7 configurations and manage the platform dynamically. This chapter will explain how to manage the Stack effectively using both the GUI and the CLI.

7.1. Linkset Management

7.1.1. Using CLI

You can manage Linksets and Links using CLI or GUI. You can create, delete, activate and deactivate linksets and links using the Shell command linkset with appropriate parameters. The linkset command can be used only when dahdi based cards are configured.

7.1.2. Using GUI

The GUI will allow you to manage your linksets and links efficiently using a user-friendly interface. Open a Web Browser and navigate to http://localhost:8080/jss7-management-console/. Click on the 'linkset' link in the left panel. The main panel will display the names of all configured Linkset Management units. To configure or view the settings of a particular Linkset Management Unit you must click on the name of that unit. The GUI will look similar to the figure below and is divided into two tabs.

Figure 12. GUI - Linkset Management

The first tab will display the properties of the Linkset Management unit. These details displayed here are fetched from the XML descriptor file *jboss-beans.xml*, which is located at *\$JBOSS_HOME/server/profile_name/deploy/mobicents-ss7-service/META-INF*, where profile_name is the server profile name. These properties cannot be modified here in the GUI. To modify them you

must modifiy the *jboss-beans.xml* and restart the Server. The GUI will then display the modified values.

The other tab will allow you to manage all Linksets and Links within this Linkset Management unit.

7.1.3. View all Linksets and Links

7.1.3.1. Using CLI

You can view the current status of all correctly configured Linksets and Links by issuing the command linkset show as described below:

```
Name
   linkset show
SYNOPSIS
   linkset show
DESCRIPTION
   This command is used to view all Links and Linksets and their states.
   The possible states of a Linkset are:
   - UNAVAILABLE : Indicates that the Linkset does not have any 'available'
               links and cannot transport traffic.
   - SHUTDOWN :
                   Indicates that Linkset has been shutdown.
                   Indicates that the Linkset has atleast one 'available'
   - AVAILABLE :
               link and can transport traffic.
   The possible states of a Link are:
                 :
                       Indicates that the Link is not 'available' to transport
   - UNAVAILABLE
               traffic. A Link is 'unavailable' if the Link is remotely
               or locally inhibited by a user. It can also be
               'unavailable' if MTP2 has not been able to successfully
               activate the link connection.
   - SHUTDOWN : Indicates the Link has been shutdown in the configuration.
   - AVAILABLE : Indicates the Link is active and 'available' to transport
               traffic.
                   Indicates that the Link is not 'shutdown' but is
   - FAILED
               'unavailable' at Layer 2 for some reason. For example, the
               Initial Alignment may fail, or the link test messages sent
               by MTP 3 are not being acknowledged.
```

7.1.3.2. Using GUI

Navigate to the specific Linkset Management unit and switch to the 'Linksets' tab. Here you can view a list of all the Linksets created. Every correctly configured Linkset will be displayed in a row and for each Linkset, the first column will display the name of the Linkset. The icon adjacent to the name will be lit 'green' if the Linkset is currently active or 'orange' if inactive. The second column will indicate the current mode of the Linkset (Configured / Not Configured), the third column will allow you to activate / deactivate the Linkset and the fourth column will allow you to delete the Linkset.

To view the details of all the Links created within a specific Linkset click on the name of the Linkset whose details you wish to view. This will launch the 'Links' view and display all the configured properties of the selected Linkset in the first tab. The second tab in this view will allow you to view all Links in this particular Linkset. You can click on any Link name here to view the configured properties. You can click on the bread crumbs at the top to return to any of the previous pages you navigated through.

7.1.4. Create a new Linkset

7.1.4.1. Using CLI

You can create a new Linkset by issuing the command linkset create with appropriate parameters as described below:

Name

linkset create

SYNOPSIS

linkset create dahdi opc <point-code> apc <point-code> ni <network-id>
<linkset-name>

DESCRIPTION

This command is used to create a new Linkset of type Dahdi as explained below. You must ensure that appropriate linkset factories are deployed prior to creating any linkset.

PARAMETERS

opc <point-code></point-code>	- MTP Point code of the originating signalling point. Takes an Integer Value.
apc <point-code></point-code>	- MTP Point code of the adjacent signalling point. Takes an Integer Value.
ni <network-id></network-id>	 Network Identifier and should be one of the following values 0 - International Network 1 - Spare (for International use) 2 - National Network 3 - Reserved for National use
<linkset-name></linkset-name>	 Name of the Linkset to be created. This will be used to identify the linkset. Takes a String value.
EXAMPLES	

linkset create dahdi opc 3 apc 4 ni 0 dahdilinkset1

The above command will create a new linkset of type Dahdi and name dahdilinkset1. The originating point code value is 3 and the adjacent point code value is 4 and the network is an international network.

7.1.4.2. Using GUI

Procedure: Create new Linkset using GUI

- 1. In the section for Linksets in the Linkset Management Unit window, click on the 'Create Linkset' button. This will launch a pop-up 'Create Linkset'.
- 2. In the 'Create Linkset' pop-up, add details of the new Linkset. You must ensure that you fill in all the mandatory parameters (OPC, DPC, NI and Linkset Name). For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new Linkset will be created with parameters as specified. If there is an error in creating the Linkset then you will find the details of the error in the Management Console Log section below.

4. Click on the 'Close' button to close the 'Create Linkset' pop-up.

7.1.5. Remove a Linkset

7.1.5.1. Using CLI

You can delete an existing Linkset by issuing the command linkset delete with appropriate parameters as described below:

```
Name
linkset delete
SYNOPSIS
linkset delete <linkset-name>
DESCRIPTION
This command is used to delete an existing Linkset.
PARAMETERS
<linkset-name> - Name of the Linkset to be deleted.
EXAMPLE
linkset delete dahdilinkset1
The above command will delete the Linkset identified by the name dahdilinkset1.
```

7.1.5.2. Using GUI

Procedure: Delete Linkset using GUI

- 1. Navigate to the 'Linksets' section in the Linkset Management Unit window and locate the row corresponding to the Linkset you wish to delete.
- 2. You must ensure that the Linkset is deactivated prior to deletion. If the Linkset is deactivated, the last column for 'Delete' will display a 'x' button in red and will be enabled. If the Linkset is currently active, the 'x' button will be disabled. You can only delete the Linkset if it is not active.
- 3. Click on the red 'x' button to delete the corresponding Linkset.

7.1.6. Activate Linkset

7.1.6.1. Using CLI

You can activate an existing Linkset by issuing the command linkset activate with appropriate parameters as described below:

Name linkset activate
SYNOPSIS linkset activate <linkset-name></linkset-name>
DESCRIPTION This command is used to activate an existing Linkset.
PARAMETERS <linkset-name> - Name of the Linkset to be activated.</linkset-name>
EXAMPLE linkset activate dahdilinkset1
The above command will activate the Linkset identified by the name dahdilinkset1.

7.1.6.2. Using GUI

Procedure: Activate a Linkset using GUI

- 1. Navigate to the 'Linksets' section in the Linkset Management Unit window and locate the row corresponding to the Linkset you wish to activate.
- 2. Click on the 'Activate' button in the actions column to activate the corresponding Linkset.
- 3. If the Linkset has been activated successfully you will find the status indicating the Linkset as 'Available' and the Linkset's icon will be lit green. If there is an error and the Linkset failed to activate, you will find details of the error in the Management Console log below.

7.1.7. Deactivate Linkset

7.1.7.1. Using CLI

You can deactivate a currently active Linkset by issuing the command linkset deactivate with appropriate parameters as described below:

Name linkset deactivate
SYNOPSIS linkset deactivate <linkset-name></linkset-name>
DESCRIPTION This command is used to deactivate an existing Linkset.
PARAMETERS <linkset-name> - Name of the Linkset to be deactivated.</linkset-name>
EXAMPLE linkset deactivate dahdilinkset1
The above command will deactivate the Linkset identified by the name dahdilinkset1.

7.1.7.2. Using GUI

Procedure: Deactivate a Linkset using GUI

- 1. Navigate to the 'Linksets' section in the Linkset Management Unit window and locate the row corresponding to the Linkset you wish to deactivate.
- 2. To deactivate a Linkset currently active, click on the 'Deactivate' button in the actions column of the row corresponding to the Linkset.

7.1.8. Create a new Link

7.1.8.1. Using CLI

You can create a new Link by issuing the command linkset link create with appropriate parameters as described below:

Name linkset link create
SYNOPSIS linkset link create span <span-num> code <code-num> channel <channel-num> <linkset-name> <link-name></link-name></linkset-name></channel-num></code-num></span-num>
DESCRIPTION This command is used to create a new Link within a Linkset. The Linkset must be created prior to executing this command.
PARAMETERS span <span-num> - Port number in the Card (indexed from 0). Takes an Integer Value.</span-num>
code <code-num> - Signaling Link code SLS (Signaling link selection) assigned to this Link. Takes an Integer Value.</code-num>
channel <channel-num> - Time Slot number (TDM time slot). Takes an Integer Value.</channel-num>
<linkset-name> - Name of the Linkset within which the new Link is being created.</linkset-name>
<pre><link-name> - Name of the Link to be created. This will be used to identify the Link. Takes a String value.</link-name></pre>
EXAMPLES linkset link create span 1 code 1 channel 1 linkset1 link1
The above command will create a new Link identified as link1 within an existing Linkset identified as linkset1.

7.1.8.2. Using GUI

Procedure: Create new Link using GUI

- 1. In the section for Links in the Linkset Management Unit window, click on the 'Create Link' button. This will launch a pop-up 'Create Link'.
- 2. In the 'Create Link' pop-up, add details of the new Link. You must ensure that you fill in all the parameters. For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new Link will be created with parameters as specified. If there is an error in creating the Link then you will find the details of the error in the Management Console Log section below.
- 4. Click on the 'Close' button to close the 'Create Link' pop-up.

7.1.9. Remove a Link

7.1.9.1. Using CLI

You can delete an existing Link by issuing the command linkset link delete with appropriate parameters as described below:

Name linkset link delete SYNOPSIS linkset link delete <linkset-name> <link-name> DESCRIPTION This command is used to delete an existing Link within a Linkset. PARAMETERS <link-name> - Name of the Link to be deleted. <linkset-name> - Name of the Linkset within which the Link resides. EXAMPLE linkset link delete linkset1 link1 The above command will delete the Link identified by the name Link1 within the Linkset linkset1.

7.1.9.2. Using GUI

Procedure: Delete Link using GUI

- 1. Navigate to the 'Links' section in the Linkset Management Unit window and locate the row corresponding to the Link you wish to delete.
- 2. You must ensure that the Link is deactivated prior to deletion. If the Link is inactive, the last column for 'Delete' will display a 'x' button in red. If the Link is currently active, the 'x' button will be displayed in orange. You can only delete the Link if it is inactive and the 'x' button is displayed in red.
- 3. Click on the red 'x' button to delete the corresponding Link instance.

7.1.10. Activate Link

7.1.10.1. Using CLI

You can activate an existing Link by issuing the command linkset link activate with appropriate parameters as described below:

Name linkset link activate
SYNOPSIS linkset link activate <linkset-name> <link-name></link-name></linkset-name>
DESCRIPTION This command is used to activate an existing Link within a Linkset.
PARAMETERS <link-name> - Name of the Link to be activated.</link-name>
<linkset-name> - Name of the Linkset within which the Link resides.</linkset-name>
EXAMPLE linkset link activate linkset1 link1
The above command will activate the Link identified by the name Link1 within the Linkset linkset1.

7.1.10.2. Using GUI

Procedure: Activate Link using GUI

- 1. Navigate to the 'Links' section in the Linkset Management Unit window and locate the row corresponding to the Link you wish to activate.
- 2. Click on the 'Activate' button to activate that Link within the Linkset.

7.1.11. Deactivate Link

7.1.11.1. Using CLI

You can deactivate a currently active Link by issuing the command linkset link deactivate with appropriate parameters as described below:

Name linkset link deactivate		
SYNOPSIS linkset link deactivate <linkset-name> <link-name></link-name></linkset-name>		
DESCRIPTION This command is used to deactivate an existing Link within a Linkset.		
PARAMETERS <link-name> - Name of the Link to be deactivated.</link-name>		
<linkset-name> - Name of the Linkset within which the Link resides.</linkset-name>		
EXAMPLE linkset link deactivate linkset1 link1		
The above command will deactivate the Link identified by the name Link1 within the Linkset linkset1.		

7.1.11.2. Using GUI

Procedure: De-activate Link using GUI

- 1. Navigate to the 'Links' section in the Linkset Management Unit window and locate the row corresponding to the Link you wish to deactivate.
- 2. Click on the 'Deactivate' button to deactivate that Link within the Linkset.

7.2. SCTP Management

7.2.1. Using CLI

You can manage all SCTP related configurations through the Command Line Interface by using the sctp command. You can create, destroy, start and stop SCTP Servers / Associations by issuing the sctp command with appropriate parameters.

7.2.2. Using GUI

The GUI will allow you to manage your SCTP Servers and Associations efficiently using a userfriendly interface. Open a Web Browser and navigate to http://localhost:8080/jss7-managementconsole/. Click on the 'SCTP' link in the left panel. The main panel will display the names of all configured SCTP Management units. To configure or view the settings of a particular SCTP Management Unit you must click on the name of that unit. The GUI will look similar to the figure below and is divided into three tabs.

telestax jss7 managem	ENT CONSOLE & Administr	rator U Sign Out
CONNECTED TO	Stream Control Transmission Protocol	
MANAGEMENT	SCTP management units SCTPManagement	
A SCTP	Carlo Details Servers Servers Associations	
SCCP	Property Value	
Alarms	Persist Dir //home/abhayani/workarea/mobicents/telestax/binary/JSLEE/ss7-ts2-telscale-slee-6.1.2.GA/jboss-5.1.0.GA/server/default/data	
MONITORING	X Started true	
Metrics	* Single Thread true * Worker Threads 8	
	x ^K Connect Delay 5000	A ¹
_		
Management Console Log	t Console ready!	i *

Figure 13. GUI - SCTP Management

The first tab will display the properties of the SCTP Management unit. These details displayed here are fetched from the XML descriptor file *jboss-beans.xml*, which is located at *\$JBOSS_HOME/server/profile_name/deploy/mobicents-ss7-service/META-INF*, where profile_name is the server profile name. These properties can be modified here in the GUI. To modify them you must click the pencil, change the value and save. The GUI will then display the modified values.

The other two tabs will allow you to manage and monitor all Servers and Associations within this SCTP Management unit.

7.2.3. SCTP stack properties

7.2.3.1. Connect Delay

7.2.3.1.1. Using CLI

You can set the 'Connect Delay (milliseconds)' by issuing the command sctp set connectdelay with appropriate parameters as described below. You can verify this by issuing the command sctp get connectdelay which will display the value set for this property.

```
Name
   sctp set connectdelay
SYNOPSIS
   sctp set connectdelay <connectdelay> stackname <stack-name>
DESCRIPTION
   If the SCTP Socket is client-side, connectDelay specifies
   the delay time in milliseconds after which a connection
   with the server will be attempted. This delay is necessary
   when there is network disruption and the connection between
   the client and the server breaks, so that the SCTP stack
   doesn't continuously attempt to reconnect.
   Defalut is 30000 milliseconds.
PARAMETERS
   Standard Parameters
   <connectdelay> - Connect delay in milliseconds.
   Optional Parameters
   <stack-name> -
                     Name of the stack on which this command is executed.
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   sctp set connectdelay 40000
```

7.2.3.1.2. Using GUI

On SCTP management page, click on pencil against the 'Connect Delay' property and text box becomes editable. Change value and save.

7.2.3.2. Single Thread

You can modify the settings for the parameter 'singlethread' only when the SCTP Stack is not running. In addition, this parameter cannot be modified through the CLI or GUI. You will have to invoke the setter function directly from the source code.

If you are using the JBoss Application Server, then you can set this parameter by adding a property (as shown below) to the XML descriptor file *jboss-beans.xml*, which is located at *\$JBOSS_HOME/server/profile_name/deploy/mobicents-ss7-service/META-INF*, where profile_name is the server profile name.

```
/*Add property for the parameter 'singleThread' to jboss-beans.xml file and specify
settings to true or false*/
<property name="singleThread">true</property>
```

The current settings of the parameter can be viewed in the GUI or by invoking the appropriate CLI command as described below.

7.2.3.2.1. Using CLI

You can retrieve the current settings of the parameter 'singlethread' by issuing the command sctp get singlethread. However as explained above, you cannot modify the settings through the CLI.

```
Name
sctp get singlethread
SYNOPSIS
sctp get singlethread
DESCRIPTION
This command is used to retrieve the current settings of the parameter
'singlethread'. The 'singlethread' parameter is used to specify if there
can be more than one worker threads dedicated to call the applications
above SCTP.
The default settings will dedicate only one thread for calling applications
above SCTP. If you wish to assign multiple worker threads, then the value of
the paramter 'singlethread' must be set to false before you can change the
number of worker threads to more than one.
The settings can be modified only when the SCTP Stack is not running.
```

To modify this parameter you must invoke the setter function directly from the code or if you are using the JBoss AS, you can add a property to the XML descriptor file jboss-beans.xml. You cannot change the settings through the CLI.

7.2.3.2.2. Using GUI

In the SCTP management page, you can view the current settings of the 'Single Thread' property. But as explained above, you cannot change the settings in the GUI. But as explained above, you cannot change the settings in the GUI. For more details about this parameter, refer to the detailed description about the parameter in the above section for CLI.

7.2.3.3. Worker Threads

You can modify the settings for the parameter 'workerthreads' only when the SCTP Stack is not running. In addition, this parameter cannot be modified through the CLI or GUI. You will have to invoke the setter function directly from the source code. If you are using the JBoss Application Server, then you can set this parameter by adding a property (as shown below) to the XML descriptor file *jboss-beans.xml*, which is located at *\$JBOSS_HOME/server/profile_name/deploy/mobicents-ss7-service/META-INF*, where profile_name is the server profile name.

```
<property for the parameter 'workerthreads' to jboss-beans.xml file and specify
the value*/
<property name="workerThreads">4</property></property>
```

The current settings of the parameter can be viewed in the GUI or by invoking the appropriate CLI command as described below.

7.2.3.3.1. Using CLI

You can retrieve the current settings of the parameter 'workerthreads' by issuing the command sctp get workerthreads. However as explained above, you cannot modify the settings through the CLI.

Name

sctp get workerthreads

SYNOPSIS

sctp get workerthreads

DESCRIPTION

This command is used to retrieve the current settings of the parameter 'workerthreads'. The 'workerthreads' parameter is used to specify the number of worker threads dedicated to call the applications above SCTP.

The default settings will dedicate only one thread for I/O and one thread for calling applications above SCTP. If you wish to assign multiple worker threads, then the value of the paramter 'singlethread' must be set to false and the number of worker threads must be set using this parameter 'workerthreads'.

The settings can be modified only when the SCTP Stack is not running. To modify this parameter you must invoke the setter function directly from the code or if you are using the JBoss AS, you can add a property to the XML descriptor file jboss-beans.xml. You cannot change the settings through the CLI.

7.2.3.3.2. Using GUI

In the SCTP management page, you can view the current settings of the 'Worker Threads' property. But as explained above, you cannot change the settings in the GUI. For more details about this parameter, refer to the detailed description about the parameter in the above section for CLI.

7.2.4. View all SCTP (or TCP) Server Instances

7.2.4.1. Using CLI

You can view the details of all configured SCTP (or TCP) Server instances by issuing the command sctp server show as described below:

```
Name
   sctp server show
SYNOPSIS
   sctp server show stackname <stack-name> stackname <stack-name>
DESCRIPTION
   This command is used to view the details of all SCTP Server instances created.
   The information displayed will include the socket type (SCTP or TCP), name of the
   Server, state (whether started=false or true), the IP address and port that the
   Server is bound to. For multi-home SCTP Servers it will display all the
   IP addresses that are configured.
PARAMETERS
   Optional Parameters
                     Name of the stack on which this command is executed.
   <stack-name> -
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
```

7.2.4.2. Using GUI

Navigate to the specific SCTP Management unit and switch to the 'Servers' tab. Here you can view a list of all the Servers created. Every correctly configured Server will be displayed in a row and for each Server, the first column will display the name of the Server. The icon adjacent to the name will be lit 'green' if the server is currently running or if the server is stopped the icon will be lit 'orange'. The second column will indicate the current state of the Server (Started / Stopped), the third column will allow you to Start / Stop the Server and the fourth column will allow you to delete the Server.

Figure 14. GUI - SCTP Management - Servers

In the screen above, click on the name of the Server whose details you wish to view. This will launch the Server Details and display all the configured properties of the selected Server. The second tab in this view will allow you to view all Associations linked to this particular Server. You can click on any Association name here to view the configured properties. You can click on the bread crumbs at the top to return to any of the previous pages you navigated through.

Figure 15. GUI - SCTP Management - Server Details

7.2.5. Create a new SCTP (or TCP) Server Instance

7.2.5.1. Using CLI

You can create a new SCTP Server by issuing the command sctp server create with appropriate parameters as described below:

Name

```
sctp server create
```

SYNOPSIS

sctp server create <sever-name> <host-ip> <host-port> <socket-type> stackname
<stack-name>

DESCRIPTION

This command is used to create a new SCTP Server (or TCP Server) instance.

PARAMETERS

Standard Parameters

- <host-ip> The host IP address to which the SCTP Server socket will bind to.

For SCTP multi-home support, you can pass multiple IP addresses as comma separated values. The Server socket will bind to the primary IP address and when it becomes unavailable, it will automatically fall back to secondary address. If the socket-type is TCP, these comma separated values will be ignored and the Server socket will always bind to the primary IP address (the first value in the comma separated list).

<host-port> - The host port to which the underlying SCTP Server
socket will bind to.

Optional Parameters

EXAMPLES

sctp server create TestServer 127.0.0.1 2905

The above command will create a new SCTP Server identified as TestServer and bind the Server socket to the IP address 127.0.0.1 and port 2905.

sctp server create TestServerMulti 10.2.50.145,10.2.50.146 2905

The above command will create a new SCTP Server identified as TestServerMulti and bind the Server socket to the IP address 10.2.50.145 and port 2905. If 10.2.50.145

```
is unavailable, the Server will automatically fall back to 10.2.50.146. sctp server create TestServerTCP 127.0.0.1 2906 TCP
```

The above command will create a new TCP Server identified as TestServerTCP and bind the socket to the IP address 127.0.0.1 and port 2906.

7.2.5.2. Using GUI

	IP Type	TCP
	Accept Anonymous	false
	Max concurrent connections	0
	Extra Host Address	

Figure 16. GUI - SCTP Management - Server Create

Procedure: Create new SCTP Server (or TCP Server) instance using GUI

- 1. In the section for Servers in the SCTP Management Unit window, click on the 'Create Server' button. This will launch a pop-up 'Create Server'.
- 2. In the 'Create Server' pop-up, add details of the new Server. You must ensure that you fill in all the mandatory parameters (Name, Host Address, Host Port, IP Type, Max Concurrent Connections). For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new SCTP Server (or TCP Server) will be created with parameters as specified. If there is an error in creating the Server then you will find the details of the error in the Management Console Log section below.
- 4. Click on the 'Close' button to close the 'Create Server' pop-up.

7.2.6. Delete a SCTP (or TCP) Server Instance

7.2.6.1. Using CLI

You can delete an existing SCTP Server by issuing the command sctp server destroy with appropriate parameters as described below:

Name sctp server destroy		
SYNOPSIS sctp server destroy <sever-name> stackname <stack-name></stack-name></sever-name>		
DESCRIPTION This command is used to delete an existing SCTP Server instance. You must ensure that the Server is stopped prior to deletion.		
PARAMETERS		
Standard Parameters		
<pre><server-name> - Name of the Server instance to be deleted.</server-name></pre>		
Optional Parameters		
<pre><stack-name> - Name of the stack on which this command is executed.</stack-name></pre>		
EXAMPLES sctp server destroy TestServer		
The above command will destroy the Server identified by the name TestServer.		

7.2.6.2. Using GUI

Procedure: Delete SCTP Server (or TCP Server) instance using GUI

- 1. Navigate to the 'Servers' section in the SCTP Management Unit window and locate the row corresponding to the Server you wish to delete.
- 2. You must ensure that the Server is stopped prior to deletion. If the Server is stopped, the last column for 'Delete' will display a 'x' button in red and will be enabled. If the Server is currently running, the 'x' button will be disabled. You can only delete the server if it is stopped.
- 3. Click on the red 'x' button to delete the corresponding Server instance.

7.2.7. Start a SCTP (or TCP) Server Instance

7.2.7.1. Using CLI

You can start an existing SCTP Server by issuing the command sctp server start with appropriate parameters as described below:

N	ame sctp server start		
S	YNOPSIS sctp server start <sever-name> stackname <stack-name></stack-name></sever-name>		
D	DESCRIPTION This command is used to start an existing SCTP Server instance. Upon executing this command, the underlying SCTP server socket is bound to the IP: Port configured for this Server instance at the time of creation using the "sctp server create" command.		
Р	ARAMETERS		
	Standard Parameters		
	<pre><server-name> - Name of the Server instance to be started.</server-name></pre>		
	Optional Parameters		
	<stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.</stack-name>		
E	XAMPLES sctp server start TestServer		
	The above command will start the previously created Server instance identified		

The above command will start the previously created Server instance identified by the name TestServer and bind the underlying socket to the IP address and port configured for TestServer at the time of creation.

7.2.7.2. Using GUI

Procedure: Start a SCTP Server (or TCP Server) instance using GUI

- 1. Navigate to the 'Servers' section in the SCTP Management Unit window and locate the row corresponding to the Server you wish to start.
- 2. Click on the 'Start' button in the actions column to start the corresponding Server instance. The SCTP Server will be started and the underlying SCTP server socket will be bound to the IP: Port configured for this Server instance at the time of creation.
- 3. If the Server has started successfully you will find the status indicating the Server as 'Started' and the Server's icon will be lit green. If there is an error and the Server failed to start, you will find details of the error in the Management Console log below.

7.2.8. Stop a SCTP (or TCP) Server Instance

7.2.8.1. Using CLI

You can stop a currently running SCTP Server by issuing the command sctp server stop with

```
Name
   sctp server stop
SYNOPSIS
   sctp server stop <sever-name> stackname <stack-name>
DESCRIPTION
   This command is used to stop an existing SCTP Server instance. Upon executing this
   command, the underlying SCTP server socket is closed and all resources are
   released.
PARAMETERS
   Standard Parameters
   <server-name> - Name of the Server instance to be stopped.
   Optional Parameters
                     Name of the stack on which this command is executed.
   <stack-name> -
                        If not passed, the first stack configured in ShellExecutor
                        will be used.
EXAMPLES
   sctp server stop TestServer
   The above command will stop the currently running Server instance identified by
   the name TestServer, close the underlying socket and release all resources.
```

7.2.8.2. Using GUI

Procedure: Stop a SCTP Server (or TCP Server) instance using GUI

- 1. Navigate to the 'Servers' section in the SCTP Management Unit window and locate the row corresponding to the Server you wish to stop.
- 2. To stop a Server currently running, click on the 'Stop' button in the actions column of the row corresponding to the Server instance. When the Server is stopped the underlying SCTP server socket will be closed and all resources are released.

7.2.9. View all SCTP (or TCP) Associations

7.2.9.1. Using CLI

You can view the details of all configured SCTP (or TCP) Associations by issuing the command sctp association show as described below:

Name				
sctp association show				
SYNOPSIS				
<pre>sctp association show stackname <stack-name></stack-name></pre>				
DESCRIPTION				
This command is used to view the details of all SCTP Associations created. The information displayed will include the Association type (SERVER or CLIENT) name of the Association, state (whether started=false or true). For a CLIENT Association it will also display the host-ip, host-port and peer-ip, peer-port values.				
For multi-home SCTP, it will display all the IP addresses that are configured. For a SERVER Association, it will display the configured peer-ip and peer-port values.				
PARAMETERS				
Optional Parameters				
<pre><stack-name> - Name of the stack on which this command is executed.</stack-name></pre>				

7.2.9.2. Using GUI

Navigate to the specific SCTP Management unit and switch to the 'Associations' tab. Here you can view a list of all the Associations created. Every correctly configured Association will be displayed in a row and for each Association, the first column will display the name of the Association. The icon adjacent to the name will be lit 'green' if the Association is currently running or if the Association is stopped the icon will be 'orange'. The second column will indicate the current state of the Association (Started / Stopped) and the third column will allow you to delete the Association.

You cannot start or stop a SCTP Association here in this window. Every SCTP Association must be associated with an ASP (M3UA) and will automatically start or stop when the associated ASP is started or stopped. For more details on how to associate with an ASP, please refer to M3UA Management.

7.2.10. Create a new SCTP (or TCP) Association

7.2.10.1. Using CLI

You can create a new SCTP Association by issuing the command sctp association create with appropriate parameters as described below:

```
Name
    sctp association create
SYNOPSIS
    sctp association create <assoc-name> <CLIENT | SERVER> <server-name> <peer-ip>
    <peer-port> <host- ip> <host-port> <socket-type> stackname <stack-name>
DESCRIPTION
    This command is used to create a new SCTP (Client side or Server side)
    association.
PARAMETERS
    Standard Parameters
                          Name of the new Association created. This must be
    <assoc-name>
                    unique and takes any String value.
    <CLIENT | SERVER> -
                          Specify if this association is client side or
                    server side. If it is client side, it will
                    initiate the connection to peer. If it is server
                    side, it will wait for peer to initiate the
```

<pre>connection. The connection request will be accepted from peer-ip: peer:port. <pre>cpeer-ip> - In a client side association, the server IP address to which the client is connecting to. In a server side association, the client IP address from which connections will be accepted. <pre>cpeer-port> - In a client side association, the server Port to which the client is connecting to. In a server side association, the client port from which connections will be accepted. <host-ip> - In a client side association, the local IP address to which the socket will bind to. For SCTP multi-home support, you can pass multiple IP addresses as comma separated values. The Association will bind to the primary IP address and when it becomes unavailable, it will automatically fall back to secondary address. If the socket-type is TCP, these comma separated values will be ignored and the Association. For a server side association, even if you specify these values it will be ignored. <host-port> - In a client side association, the local port to which the socket will bind to. This is required only for a client side Association. For a server side association, even if you specify these values it will be ignored. <host-port> - In a client side association, the local port to which the socket will bind to. This is required only for a client side Association. For a server side association, the server-name must be passed to associate with the Server identified by that name. You must ensure that the Server identified by server-name has already been created using the sctp server create command. In a client-side association, this is not required and you should not pass this parameter.</host-port></host-port></host-ip></pre></pre></pre>

Optional Parameters</server-name>	<host-port></host-port>	- In a client side association, the local port to which the socket will bind to. This is required only for a client side Association.
<pre><server-name> - In a server-side association, the server-name must be passed to associate with the Server identified by that name. You must ensure that the Server identified by server-name has already been created using the sctp server create command. In a client-side association, this is not required and you should not pass this parameter. Optional Parameters</server-name></pre>		For a server side association, even if you specify these values it will be ignored.
In a client-side association, this is not required and you should not pass this parameter. Optional Parameters	<server-name> -</server-name>	In a server-side association, the server-name must be passed to associate with the Server identified by that name. You must ensure that the Server identified by server-name has already been created using the sctp server create command.
Optional Parameters		In a client-side association, this is not required and you should not pass this parameter.
readent types	Optional Parame	ters
	coolict to a	If you do not conside the seclect type of "TAD"

by default it will be SCTP. If it is a
match with the one specified while creating the
Server.
<pre><stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellEvecutor</stack-name></pre>
will be used.
EXAMPLES
sctp association create Assoc1 CLIENT
192.108.50.101 2905 192.108.50.1,192.108.50.1 2905
The above command will create a new CLIENT SCTP Association identified as Assoc1.
The client side will initiate the connection. It will bind the
host-ip 192.168.56.1 and host-port 2905 to the Server IP 192.168.56.101 and
port 2905.
sctp association create Assoc2 SERVER TestServer 192.168.56.1 2905
The above command will create a new SERVER SCTP association with the Server
identified as TestServer and accept connections from peer whose IP address is
192.108.30.1 and poit 2903.

7.2.10.2. Using GUI

Procedure: Create new SCTP (or TCP) Association (Client side or Server side)

- 1. In the section for Associations in the SCTP Management Unit window, click on the 'Create Association' button. This will launch a pop-up 'Create Association'.
- 2. In the 'Create Association' pop-up, add details of the new Association. You must ensure that you fill in all the mandatory parameters: Name, Peer Address, Peer Port, Server Name (for Server side Association), Host Address and Host Port (for Client side Association). For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new SCTP Association (or TCP Association) will be created with parameters as specified. If there is an error in creating the Association then you will find the details of the error in the Management Console Log section below.
- 4. Click on the 'Close' button to close the 'Create Association' pop-up.

7.2.11. Delete a SCTP (or TCP) Association

7.2.11.1. Using CLI

You can delete an existing SCTP Association by issuing the command sctp association destroy as described below:

Name sctp association destroy
SYNOPSIS sctp association destroy <assoc-name> stackname <stack-name></stack-name></assoc-name>
DESCRIPTION This command is used to delete an existing SCTP Association identified by the name assoc-name.
PARAMETERS
Standard Parameters
<assoc-name> - Name of the Association to be deleted.</assoc-name>
Optional Parameters
<pre><stack-name> - Name of the stack on which this command is executed.</stack-name></pre>
EXAMPLES sctp association destroy Assoc1
The above command will destroy the Association identified by the name Assoc1.

7.2.11.2. Using GUI

Procedure: Delete SCTP Association (or TCP Association) instance

- 1. Navigate to the 'Associations' section in the SCTP Management Unit window and locate the row corresponding to the Association you wish to delete.
- 2. You must ensure that the Association is stopped prior to deletion. If the Association is stopped, the last column for 'Delete' will display a 'x' button in red. If the Association is currently running, the 'x' button will be displayed in orange. You can only delete the Association if it is stopped and the 'x' button is displayed in red.
- 3. Click on the red 'x' button to delete the corresponding Association instance.

7.3. M3UA Management

7.3.1. Using CLI

You can manage all M3UA Application Server, Application Server Process and Route related configurations through the Command Line Interface by using the m3ua command. You can create, destroy, start and stop ASPs by issuing the m3ua asp command with appropriate parameters. You can create, destroy, add and remove AS by issuing the m3ua as command with appropriate parameters. You can add and remove M3UA Routes by issuing the m3ua route command with appropriate

parameters.

7.3.2. Using GUI

The GUI will allow you to manage your M3UA configurations efficiently using a user-friendly interface. Open a Web Browser and navigate to http://localhost:8080/jss7-management-console/. Click on the 'M3UA' link in the left panel. The main panel will display the names of all configured M3UA Management units. To configure or view the settings of a particular M3UA Management Unit you must click on the name of that unit. The GUI will look similar to the figure below and is divided into four tabs.

🔇 📎 🦿 🖹 localhost:8080/jss7-management-console/	#	@ 😭 🛞 🖬 🔳

Management Console Log		⊡
12:44:47:322 [INFO] Telscale jSS7 Management Co	onsole ready!	

Figure 18. GUI - M3UA Management

The first tab will display the properties of the M3UA Management unit. These details displayed here are fetched from the XML descriptor file *jboss-beans.xml*, which is located at *\$JBOSS_HOME/server/profile_name/deploy/mobicents-ss7-service/META-INF*, where profile_name is the server profile name. These properties can be modified here in the GUI. To modify them you must click the pencil, change value and save. The GUI will then display the modified values.

The other three tabs will allow you to manage and monitor all Servers, ASPs and Routers within this M3UA Management unit.

7.3.3. M3UA stack properties

7.3.3.1. Maximum Sequence Number

You can modify the settings for the parameter 'maxsequencenumber' only when the M3UA Stack is not running. In addition, this parameter cannot be modified through the CLI or GUI. You will have to invoke the setter function directly from the source code.

If you are using the JBoss Application Server, then you can set this parameter by adding a property (as shown below) to the XML descriptor file *jboss-beans.xml*, which is located at *\$JBOSS_HOME/server/profile_name/deploy/mobicents-ss7-service/META-INF*, where profile_name is

the server profile name.

```
/*Add property for the parameter 'maxsequencenumber' to jboss-beans.xml file and
specify the value*/
<property name="maxSequenceNumber">128</property>
```

The current settings of the parameter can be viewed in the GUI or by invoking the appropriate CLI command as described below.

7.3.3.1.1. Using CLI

You can retrieve the current settings of the parameter 'maxsequencenumber' by issuing the command sctp get maxsequencenumber. However as explained above, you cannot modify the settings through the CLI.

m3ua get maxsequencenumber

SYNOPSIS

Name

m3ua get maxsequencenumber

DESCRIPTION

This command is used to retrieve the current settings of the parameter 'maxsequencenumber'. The 'maxsequencenumber' parameter is used to specify the maximum sequence number used for load-balancing algorithm.

Sequence number or Signalling Link Selection (SLS) is used for load-balancing between ASPs in AS and also between various AS for the same point-code. The parameter 'maxsequencenumber' controls the maximum SLS that should be used for this. It is safe to leave it at 256.

The settings can be modified only when the M3UA Stack is not running. To modify this parameter you must invoke the setter function directly from the code or if you are using the JBoss AS, you can add a property to the XML descriptor file jboss-beans.xml. You cannot change the settings through the CLI.

7.3.3.1.2. Using GUI

In the M3UA management page, you can view the current settings of the 'Max Sequence Number' property. But as explained above, you cannot change the settings in the GUI. For more details about this parameter, refer to the detailed description about the parameter in the above section for CLI.

7.3.3.2. Maximum AS for route

You can modify the settings for the parameter 'maxasforroute' only when the M3UA Stack is not running. In addition, this parameter cannot be modified through the CLI or GUI. You will have to invoke the setter function directly from the source code.

If you are using the JBoss Application Server, then you can set this parameter by adding a property (as shown below) to the XML descriptor file *jboss-beans.xml*, which is located at *\$JBOSS_HOME/server/profile_name/deploy/mobicents-ss7-service/META-INF*, where profile_name is the server profile name.

```
<property for the parameter 'maxasforroute' to jboss-beans.xml file and specify
the value*/
<property name="maxAsForRoute">4</property></property>
```

The current settings of the parameter can be viewed in the GUI or by invoking the appropriate CLI command as described below.

7.3.3.2.1. Using CLI

You can retrieve the current settings of the parameter 'maxasforroute' by issuing the command sctp get maxasforroute. However as explained above, you cannot modify the settings through the CLI.

Name

m3ua get maxasforroute

SYNOPSIS

m3ua get maxasforroute

DESCRIPTION

This command is used to retrieve the current settings of the parameter 'maxasforroute'. The 'maxasforroute' parameter is used to specify the maximum routes for destination point code.

Every destination point code should be configured in M3UA with the corresponding AS. The parameter 'maxasforroute' controls the maximum number of AS that can be used to route the message to the same Destination Point Code.

It is better to always maintain this parameter as an even number for better load-sharing and a maximum of 2 is standard and widely accepted. You should not change this value if there is at least one route defined, else it will throw Exception for that route. You have to delete all the routes, change this property and redefine routes.

The settings can be modified only when the M3UA Stack is not running. To modify this parameter you must invoke the setter function directly from the code or if you are using the JBoss AS, you can add a property to the XML descriptor file jboss-beans.xml. You cannot change the settings through the CLI.

7.3.3.2.2. Using GUI

In the M3UA management page, you can view the current settings of the 'Max As for Route'

property. But as explained above, you cannot change the settings in the GUI. For more details about this parameter, refer to the detailed description about the parameter in the above section for CLI.

7.3.3.3. Heart Beat time

7.3.3.3.1. Using CLI

You can set the 'heartbeattime' by issuing the command m3ua set heartbeattime with appropriate parameters as described below. You can verify this by issuing the command m3ua get heartbeattime which will display the value set for this property.

```
Name
   m3ua set heartbeattime
SYNOPSIS
   m3ua set heartbeattime <heartbeattime> stackname <stack-name>
DESCRIPTION
    Each ASP can send HEART_BEAT to peer to determine the availability of
    link. If there is no traffic M3UA will initiate heart beat every
    'heartbeatTime' milli seconds. If 3 consecutive HEART_BEAT are
   missed, stack will close and re-initiate connection.
PARAMETERS
    Standard Parameters
    <heartbeattime> -
                         Heart Beat time in milliseconds.
    Optional Parameters
    <stack-name> - Name of the stack on which this command is executed.
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   m3ua set heartbeattime 30000
```

7.3.3.3.2. Using GUI

On M3UA management page, click on pencil against the 'Worker Threads' property and text box becomes editable. Change value and save.

7.3.4. View all M3UA Application Server Processes

7.3.4.1. Using CLI

You can view the details of all configured M3UA Application Server Processes by issuing the command m3ua asp show as described below:
Name m3ua asp show			
SYNOPSIS m3ua asp show stackname <stack-name></stack-name>			
DESCRIPTION This command is used to view the details of all configured Application Server Processes. The information displayed will include the name, the SCTP Association name and if it is started or stopped.			
PARAMETERS			
Optional Parameters			
<pre><stack-name> - Name of the stack on which this command is executed.</stack-name></pre>			

7.3.4.2. Using GUI

Navigate to the specific M3UA Management unit and switch to the 'AspFactories' tab. Here you can view a list of all the ASPs created. Every correctly configured ASP will be displayed in a row and for each ASP, the first column will display the name of the ASP. The icon adjacent to the name will be lit 'green' if the ASP is currently running or if the ASP is stopped the icon will be lit 'orange'. The second column will indicate the current state of the ASP (true / false), the third column will allow you to Start / Stop the ASP and the fourth column will allow you to delete the ASP.

Figure 19. GUI - M3UA Management - AspFactories

In the screen above, click on the name of the ASP whose details you wish to view. This will launch the ASP Details and display all the configured properties of the selected ASP. The second tab in this view will allow you to view all connected Application Servers. You can click on the bread crumbs at the top to return to any of the previous pages you navigated through.

Figure 20. GUI - M3UA Management - ASP Details

7.3.5. Create a new M3UA Application Server Process

7.3.5.1. Using CLI

You can create a new M3UA ASP by issuing the command m3ua asp create with appropriate parameters as described below:

```
Name
   m3ua asp create
SYNOPSTS
   m3ua asp create <asp-name> <sctp-association> aspid <aspid> heartbeat <true | false>
    stackname <stack-name>
DESCRIPTION
    This command is used to create a new Application Server Process.
PARAMETERS
    Standard Parameters
                              Name of the new Application Server Process
    <asp-name>
                          -
                        created. This must be unique and takes any
                        String value.
                                  Name of the SCTP Association
    <sctp-association>
                              -
    Optional Parameters
    <aspid>
                              Identifier for this newly created
                          -
```

A	pplication Server Process. If this is			
n	ot passed, next available aspid will be			
u	sed.			
heartbeat <true false< td=""><td>If this parameter is enabled (value set to</td></true false<>	If this parameter is enabled (value set to			
t	rue), then heartbeat mechanism is enabled			
b	etween M3UA peers. When this is enabled,			
i	t sends a Heartbeat message every 10			
s	econds. If there is no response for the			
t	hird heartbeat then it assumes that the			
u	nderlying network is dead. So it closes			
t	he connection and attempts to connect			
a	gain. The M3UA peers are brought back to			
t	he same state as they were prior to			
d	ying.			
T	his is an optional parameter and if			
u	nspecified, heartbeat mechanism is			
d	isabled.			
<stack-name> - Nam</stack-name>	e of the stack on which this command is executed.			
I	f not passed, the first stack configured in ShellExecutor			
w	ill be used.			
EXAMPLES m3ua asp create ASP1 Assoc1 aspid 12 heartbeat true				
The above command will create a new M3UA Application Server Process with name ASP1 and id 12. Heartbeat mechanism is enabled.				

7.3.5.2. Using GUI

Procedure: Create a new Application Server Process using GUI

- 1. Navigate to the tab 'AspFactories' in the M3UA Management Unit window and click on the 'Create ASP' button. This will launch a pop-up 'Create AspFactory'.
- 2. In the 'Create ASP' page, add details of the new ASP. You must ensure that you fill in all the mandatory parameters (Name, SCTP Association Name). For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section. You must ensure that a correctly configured SCTP Association is created and available prior to creating a new ASP. When the ASP is started or stopped, this corresponding SCTP Association will start / stop automatically.
- 3. Verify the details entered and then click on the 'Create' button. A new ASP will be created with parameters as specified. If there is an error in creating the ASP then you will find the details of the error in the Management Console Log section below.
- 4. Click on the 'Close' button to close the 'Create Server' pop-up.

7.3.6. Delete an Application Server Process

7.3.6.1. Using CLI

You can delete an existing M3UA ASP by issuing the command m3ua asp destroy with appropriate parameters as described below:

Name m3ua asp destroy SYNOPSIS m3ua asp destroy <asp-name> stackname <stack-name> DESCRIPTION This command is used to delete an existing M3UA Application Server Process identified by the name 'asp-name'. You must ensure that the ASP is stopped prior to issuing the command. PARAMETERS Standard Parameters Name of the ASP to be deleted. <asp-name> -**Optional Parameters** Name of the stack on which this command is executed. <stack-name> -If not passed, the first stack configured in ShellExecutor will be used. EXAMPLES m3ua asp destroy ASP1 The above command will destroy the ASP identified by the name ASP1.

7.3.6.2. Using GUI

Procedure: Delete an Application Server Process using GUI

- 1. Navigate to the 'ASPs' section in the M3UA Management Unit window and locate the row corresponding to the ASP you wish to delete.
- 2. You must ensure that the ASP is stopped and unassigned from AS prior to deletion. If the ASP is stopped, the last column for 'Delete' will display a 'x' button in red and will be enabled. If the Server is currently running, the 'x' button will be disabled.
- 3. Click on the red 'x' button to delete the corresponding ASP.

7.3.7. Start an Application Server Process

7.3.7.1. Using CLI

You can start an existing ASP by issuing the command m3ua asp start with appropriate parameters as described below:

```
Name
   m3ua asp start
SYNOPSIS
   m3ua asp start <asp-name> stackname <stack-name>
DESCRIPTION
   This command is used to start an existing ASP. You must ensure that the ASP is
   assigned to at least one AS prior to starting it.
PARAMETERS
   Standard Parameters
                         Name of the ASP to be started.
   <asp-name>
               -
   Optional Parameters
   <stack-name> -
                     Name of the stack on which this command is executed.
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   m3ua asp start ASP1
   The above command will start the ASP identified by the name ASP1.
```

7.3.7.2. Using GUI

Procedure: Start an Application Server Process

- 1. Navigate to the 'AspFactories' tab in the M3UA Management Unit window and locate the row corresponding to the ASP you wish to start.
- 2. Click on the 'Start' button in the actions column to start the corresponding ASP. You must ensure that the ASP is assigned to at least one AS prior to starting it.
- 3. If the ASP has started successfully you will find the status indicating the ASP running as 'true' and the icon will be lit green. If there is an error and the ASP failed to start, you will find details of the error in the Management Console log below.

7.3.8. Stop an Application Server Process

7.3.8.1. Using CLI

You can stop a currently running ASP by issuing the command m3ua asp stop with appropriate

```
Name
   m3ua asp stop
SYNOPSIS
   m3ua asp stop <asp-name> stackname <stack-name>
DESCRIPTION
    This command is used to stop a currently running ASP.
PARAMETERS
    Standard Parameters
    <asp-name>
                      - Name of the ASP to be stopped.
    Optional Parameters
                      Name of the stack on which this command is executed.
    <stack-name> -
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   m3ua asp stop ASP1
   The above command will stop the ASP identified by the name ASP1.
```

7.3.8.2. Using GUI

Procedure: Stop an Application Server Process

- 1. Navigate to the 'AspFactories' section in the M3UA Management Unit window and locate the row corresponding to the ASP you wish to stop.
- 2. Click on the 'Stop' button in the actions column to stop the corresponding ASP.
- 3. If the ASP has stopped successfully you will find the status indicating the ASP running as 'false' and the icon will be lit orange. If there is an error and the ASP failed to stop, you will find details of the error in the Management Console log below.

7.3.9. View all M3UA Application Servers

7.3.9.1. Using CLI

You can view the details of all configured M3UA Application Servers by issuing the command m3ua as show as described below:

Name m3ua as show				
SYNOPSIS m3ua as show stackname <stack-name></stack-name>				
DESCRIPTION This command is used to view the details of all configured Application Servers. The information displayed will include the configured functionality (AS or IPSP or SGW), mode (SE or DE), IPSP type (if applicable), routing context, traffic mode and network appearance values.				
PARAMETERS				
Optional Parameters				
<pre><stack-name> - Name of the stack on which this command is executed.</stack-name></pre>				

7.3.9.2. Using GUI

Navigate to the specific M3UA Management unit and switch to the 'ApplicationServers' tab. Here you can view a list of all the ASs created. Every correctly configured AS will be displayed in a row and for each AS, the first column will display the name of the AS. The icon adjacent to the name will be lit 'green' if the AS is currently running or if the AS is stopped the icon will be lit 'orange'. The second column will indicate the current state of the AS (defined / undefined), the third column will allow you to delete the AS.

Figure 22. GUI - M3UA Management - AS Details

7.3.10. Create a new M3UA AS

7.3.10.1. Using CLI

You can create a new M3UA AS by issuing the command m3ua as create with appropriate parameters as described below:

Na	me
	m3ua as create
SY	NOPSIS m3ua as create <as-name> <as ipsp="" sgw="" =""> mode <se de="" =""> ipspType <client server="" =""> rc <routing- context=""> traffic-mode <traffic mode=""> min-asp <minimum active="" asp="" for="" trafficmodetype.loadshare=""> network-appearance <network appearance="" value=""> stackname <stack-name></stack-name></network></minimum></traffic></routing-></client></se></as></as-name>
DE	SCRIPTION This command is used to create a new Application Server.
PA	RAMETERS
	Standard Parameters
	<as-name> - Name of the new Server created. This must be unique and takes any String value.</as-name>
	<as ipsp="" sgw="" =""> - The type of the new Server is specified using this parameter. The three possible values are AS (Application Server), SGW (Signaling Gateway)</as>

 	and IPSP.
<se de="" =""> -</se>	You must specify if Single Exchange or Double Exchange of ASPSM (ASP State Maintenance) and ASPTM (ASP Traffic Maintenance) messages should be performed.
<client serve<="" td="" =""><td>r> - This is required if the newly created AS is of type IPSP. You must specify is if it is of type Client or Server.</td></client>	r> - This is required if the newly created AS is of type IPSP. You must specify is if it is of type Client or Server.
Optional Parame	ters
<routing-contex< td=""><td>t> - This refers to the Routing Context configured for M3UA Stack on SGW. This parameter is optional.</td></routing-contex<>	t> - This refers to the Routing Context configured for M3UA Stack on SGW. This parameter is optional.
	However for an ASP (Application Server Process) assigned to this AS to be configured to process signaling traffic related to more than one AS over a single SCTP Association, it is mandatory to specify a routing-context for the AS. If an ASP is configured to always process signaling traffic from one AS, irrespective of whether the received messages have routing context set or not, it will always be delivered to AS for further processing.
	However if an ASP is configured to process signaling traffic related to more than one AS over a single SCTP Association and if a signaling message is received without RC, then the ASP will drop the message and send back an Error message. A respective log4j error will also be logged.
<traffic-mode></traffic-mode>	- You may choose to specify the traffic mode for ASPs. At the moment jSS7 M3UA supports only 2 modes: loadshare and override. Broadcast mode is not supported.
	This is an optional parameter and if not specified the default mode is 'loadshare'.
<min-asp></min-asp>	- You may choose to specify the minumum asp active for traffic mode 'loadshare' before the payload starts flowing.
	This is an optional parameter and if not specified the default value is 1. Also if traffic-mode is not 'loadshare' setting this value has no effect.
<network-appear< td=""><td>ance> - This is a M3UA local reference (typically an integer) shared by SG and AS. This value together</td></network-appear<>	ance> - This is a M3UA local reference (typically an integer) shared by SG and AS. This value together

```
with a Signaling Point Code, uniquely identifies a
                    SS7 node by indicating the specific SS7 network to
                    which it belongs. It can be used to distinguish
                    between signalling traffic, associated with
                    different networks, being sent between the SG and
                    the ASP over a common SCTP association.
                      Name of the stack on which this command is executed.
   <stack-name> -
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   m3ua as create AS1 IPSP mode DE ipspType server rc 1 traffic-mode loadshare
   The above command will create a new M3UA Application Server identified as AS1,
   of type IPSP (Server), Double Exchange mode. The Routing Context is 1 and
   traffic-mode is 'loadshare'.
   m3ua as create AS2 AS mode SE rc 100 traffic-mode loadshare 2 network-appearance
12
   The above command will create a new M3UA Application Server identified as AS2,
   of type AS, Single Exchange mode. The Routing Context is 100,
   traffic-mode is 'loadshare' and minimun asp to be active for payload transfer is
2.
   The network-appearance value is 12.
```

7.3.10.2. Using GUI

Procedure: Create a new M3UA Application Server using GUI

- 1. Navigate to the tab 'ApplicationServers' in the M3UA Management Unit window and click on the 'Create AS' button. This will launch a pop-up 'Create AS'.
- 2. In the 'Create Application Server' pop-up, add details of the new AS. For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new AS will be created with parameters as specified. If there is an error in creating the AS then you will find the details of the error in the Management Console Log section below.
- 4. Click on the 'Close' button to close the 'Create Application Server' pop-up.

7.3.11. Delete a M3UA AS

7.3.11.1. Using CLI

You can create a new M3UA AS by issuing the command m3ua as create with appropriate parameters as described below:

```
Name
   m3ua as destroy
SYNOPSIS
   m3ua as destroy <as-name> stackname <stack-name>
DESCRIPTION
    This command is used to delete an existing M3UA Application Server instance
    identified by the name 'as-name'. You must ensure that all ASPs are unassigned and
    the AS state is 'INACTIVE' prior to destroying the AS.
PARAMETERS
   Standard Parameters
                     Name of the AS instance to be deleted.
    <as-name>
    Optional Parameters
                      Name of the stack on which this command is executed.
    <stack-name> -
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   m3ua as destroy AS1
   The above command will destroy the AS identified by the name AS1.
```

7.3.11.2. Using GUI

Procedure: Delete a M3UA Application Server using GUI

- 1. Navigate to the 'ApplicationServers' tab in the M3UA Management Unit window and locate the row corresponding to the AS you wish to delete.
- 2. You must ensure that all ASPs are unassigned from this AS and the current state of the AS is 'INACTIVE' (displayed as 'undefined') prior to destroying the AS. If the AS is inactive, the last column for 'Delete' will display a 'x' button in red and will be enabled. You can only delete the AS if it is inactive.
- 3. Click on the red 'x' button to delete the corresponding AS.

7.3.12. Assign an ASP to an AS

7.3.12.1. Using CLI

You can assign an ASP to an AS by issuing the command m_{3ua} as add with appropriate parameters as described below:

```
Name
   m3ua as add
SYNOPSIS
   m3ua as add <as-name> <asp-name> stackname <stack-name>
DESCRIPTION
   This command is used to assign an Application Server Process to an Application
   Server. The AS and ASP must both be created prior to executing this command.
   You can configure an ASP to process signaling traffic related to more than one AS,
   over a single SCTP Association. However you must ensure that all the Application
   Servers that share the ASP are configured with a valid Routing Context value.
PARAMETERS
   Standard Parameters
                     Name of the AS to which this ASP is being assigned.
   <as-name>
                          Name of the ASP that is being assigned to the AS.
   <asp-name>
                      _
   Optional Parameters
   <stack-name> - Name of the stack on which this command is executed.
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   m3ua as add AS1 ASP1
   - The above command will assign ASP1 to AS1.
```

7.3.12.2. Using GUI

Procedure: Assign an ASP to an AS using GUI

- 1. Navigate to the 'ApplicationServers' tab in the M3UA Management Unit window, locate the row corresponding to the AS you wish to assign an ASP and click on the name of the AS.
- 2. This will launch the AS details page where all the properties of the AS will be displayed. Switch to the second tab in this view called "Application Server Processes". As shown in the figure below, you will find a list of all currently assigned ASPs to this selected AS.

Figure 23. GUI - M3UA Management - Assign ASP to an AS

- 3. Click on the 'Add ASP' button at the bottom. This will launch a pop-up named 'Add ASP' where all available ASPs will be listed in a drop down box.
- 4. Click on the 'Create' button to add the selected ASP to this AS. The ASP will be assigned to this AS and will be displayed in the ASP list for this AS.
- 5. You can configure an ASP to process signaling traffic related to more than one AS, over a single SCTP Association. However you must ensure that all the Application Servers that share the ASP are configured with a valid Routing Context value.

7.3.13. Unassign an ASP from an AS

7.3.13.1. Using CLI

You can unassign an ASP from an AS by issuing the command m3ua as remove with appropriate parameters as described below:

```
Name
   m3ua as remove
SYNOPSIS
   m3ua as remove <as-name> <asp-name> stackname <stack-name>
DESCRIPTION
    This command is used to un-assign an Application Server Process from an
    Application Server that it was previously assigned to.
PARAMETERS
    Standard Parameters
                      Name of the AS from which this ASP is being
    <as-name>
                  -
                    un-assigned.
                          Name of the ASP to be un-assigned.
    <asp-name>
                      _
    Optional Parameters
    <stack-name> - Name of the stack on which this command is executed.
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   m3ua as remove AS1 ASP1
    The above command will remove ASP1 from AS1.
```

7.3.13.2. Using GUI

Procedure: Unassign an ASP from an AS using GUI

- 1. Navigate to the 'ApplicationServers' tab in the M3UA Management Unit window, locate the row corresponding to the AS you wish to unassign an ASP from and click on the name of the AS.
- 2. This will launch the AS details page where all the properties of the AS will be displayed. Switch to the second tab in this view called "Application Server Processes". As shown in the figure above, you will find a list of all currently assigned ASPs to this selected AS.
- 3. Locate the row corresponding to the ASP you wish to unassign from this AS.
- 4. Click on the red coloured 'x' remove button in the row corresponding to the ASP you wish to remove. This action will unassign the ASP from this AS.

7.3.14. View all M3UA Routes

7.3.14.1. Using CLI

You can view the details of all configured M3UA Routes by issuing the command m3ua route show as

described below:

Name m3ua route show				
SYNOPSIS m3ua route show	stackname <stack-name></stack-name>			
DESCRIPTION This command is used to display all configured routes.				
PARAMETERS				
Optional Parameters				
<stack-name> -</stack-name>	Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.			

7.3.14.2. Using GUI

Navigate to the specific M3UA Management unit and switch to the 'Routers' tab. Here you can view a list of all the Routes created as shown in the figure below. Every correctly configured Route will be displayed in a row and for each Route, the first column will display DPC:OPC:SI values. The icon adjacent to the name will be lit 'green' if the Route is currently active or if the Route is inactive the icon will be 'orange'. The second column will indicate the current state of the Route (Active / Inactive) and the third column will display the name of the AS assigned to route messages for this DPC.

Figure 24. GUI - M3UA Management - Route

7.3.15. Create a new M3UA Route

7.3.15.1. Using CLI

You can create a new M3UA Route by issuing the command m3ua route add with appropriate parameters as described below:

Name m3ua route add SYNOPSIS m3ua route add <as-name> <dpc> <si> trafficmode <traffic-mode> stackname <stack-name> DESCRIPTION This command is used to configure an AS to route message, i.e. configure the destination point code that the message will be routed to. You must ensure that the AS is created prior to executing this command. PARAMETERS Standard Parameters Name of the AS assigned to route message for <as-name> this dpc. Destination Point Code. -<dpc> Originating Point Code. <opc> -Service Indicator. <si> _ Optional Parameters <traffic-mode> There can be two or more AS defined for each route. The M3UA Stack will do load-balancing between these AS depending on the traffic-mode set for this m3ua route. Possible values are: 1. Override 2. Loadshare 3. Broadcast (Broadcast is not yet supported by M3UA) Name of the stack on which this command is executed. <stack-name> -If this is not passed, the first stack configured in ShellExecutor will be used. EXAMPLES m3ua route add AS1 2 -1 -1

7.3.15.2. Using GUI

Procedure: Create a new M3UA Route using GUI

- 1. Navigate to the 'Routers' tab in the M3UA Management Unit window and click on the 'Create/Remove' button.
- 2. This will launch the pop-up 'Create/Remove Route', where you can add values for DPC, OPC, SI, traffic-mode and Application Server Name. For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new Route will be configured with parameters as specified. If there is an error in creating the Route then you will find the details of the error in the Management Console Log section below.

7.3.16. Delete a M3UA Route

7.3.16.1. Using CLI

You can delete a M3UA Route by issuing the command m3ua route remove with appropriate parameters as described below:

```
Name
   m3ua route remove
SYNOPSIS
   m3ua route remove <as-name> <dpc> <opc> <si> stackname <stack-name>
DESCRIPTION
    This command is used to remove a previously configured route.
PARAMETERS
    Standard Parameters
                      Name of the AS assigned to route message for
    <as-name>
                    this dpc.
                      Destination Point Code.
    <dpc>
                     Originating Point Code.
    <opc>
                  -
                     Service Indicator.
    <si>
                  -
    Optional Parameters
    <stack-name> - Name of the stack on which this command is executed.
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   m3ua route remove AS1 2 -1 -1
```

7.3.16.2. Using GUI

Procedure: Delete a M3UA Route using GUI

- 1. Navigate to the 'Routers' tab in the M3UA Management Unit window and click on the 'Create/Remove' button.
- 2. This will launch the pop-up 'Create/Remove Route'. Enter the values for DPC, OPC, SI and Application Server Name that you wish to remove from the list of Routes. For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Click on the 'Remove' button to delete the Route corresponding to the parameters specified.

7.4. SCCP Management

SCCP provides connectionless and connection-oriented network services. This includes address(GTT) translation and routing, flow control, segmentation and reassembly. A global title is an address (e.g., a dialed 800 number, calling card number, or mobile subscriber identification

number) which is translated by SCCP into a destination point code and subsystem number. A subsystem number uniquely identifies an application at the destination signaling point. is used as the transport layer for -based services.

The first step in configuring SCCP is defining service access points (sap). This step is mandatory. Each SCCP stack can use one or more Mtp3UserPart (Refer [_configuring_sccp] about Mtp3UserPart settings). A sap is a logical definition of the Mtp3UserPart [corresponding local SPC, network indicator (NI) and a set of destinations (remote SPC list)].

The second step is the definition of a list of available remote signaling pointcodes (SPC - rsp) and a list of available remote Sub-Systems (SNN - rss). This step is also mandatory. If routing only by GlobalTitle is used then it is not required to configure remote Sub-Systems.

Since acts as a message router, it is required to configure routing information. Rules (rule), primary and backup (address) (if backup addresses are available) addresses should be configured. If XUDT and LUDT messages are available in the SS7 network, you should configure a set of long message rules (lmr) that will allow long messages. This step is not mandatory. If no long message rules are configured only UDT messages will be used.

The last step is optional. You can configure a set of concerned signaling point codes (csp). Each point code will be announced when local SCCP user becomes unavailable.

7.4.1. Using CLI

You can manage all SCCP related configurations through the Command Line Interface by using the sccp command with appropriate parameters. You can create, modify, delete and view SCCP Service Access Points (sap) and Destinations (dest), Remote Signaling Point Codes (rsp), Remote Sub Systems (rss), Concerned Signaling Point Codes (csp), Routing information (rules, primary and backup addresses) and Long Message Rules (lmr). You can also set and get values for general parameters using this command.

7.4.2. Using GUI

The GUI will allow you to manage your SCCP configurations efficiently using a user-friendly interface. Open a Web Browser and navigate to http://localhost:8080/jss7-management-console/. Click on the 'SCCP' link in the left panel. The main panel will display the names of all configured SCCP Management units. To configure or view the settings of a particular SCCP Management Unit you must click on the name of that unit. The GUI will look similar to the figure below and is divided into tabs.

The first tab will display the properties of the SCCP Management unit. These details displayed here are fetched from the XML descriptor file *jboss-beans.xml*, which is located at *\$JBOSS_HOME/server/profile_name/deploy/mobicents-ss7-service/META-INF*, where profile_name is the server profile name. These properties can be modified here in the GUI. To modify them you must click on pencil, make changes and save. The GUI will then display the modified values.

Figure 25. GUI - SCCP Management

The other seven tabs will allow you to manage all SCCP configurations within this SCCP Management unit.

7.4.3. SCCP stack properties

7.4.3.1. SCCP protocol version

7.4.3.1.1. Using CLI

We can specify which protocol specification will use SCCP stack (ITU-T or ANSI).

You can set the 'scopprotocolversion' by issuing the command scop set scopprotocolversion with appropriate parameters as described below. You can verify this by issuing the command scop get scopprotocolversion which will display the value set for this property.

Name sccp set sccpprotocolversion
SYNOPSIS sccp set sccpprotocolversion <itu ansi="" =""> stackname <stack-name></stack-name></itu>
DESCRIPTION Sets the value for sccpprotocolversion property ITU or ANSI. Default value is ITU.
PARAMETERS
Optional Parameters
<stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.</stack-name>
EXAMPLES sccp set sccpprotocolversion ITU

7.4.3.1.2. Using GUI

On SCCP management page, click on pencil against the 'ReservedForNationalUseValue of AddressIndicator' property and text box becomes editable. Change value and save.

7.4.3.2. Maximum Data Message

7.4.3.2.1. Using CLI

You can set the 'maxdatamessage' by issuing the command sccp set maxdatamessage with appropriate parameters as described below. You can verify this by issuing the command sccp get maxdatamessage which will display the value set for this property.

Name sccp set maxdatamessage SYNOPSIS sccp set maxdatamessage <maxdatamessage> stackname <stack-name> DESCRIPTION Sets Max available SCCP message data for all message types. Range is 2560 to 3952. If passed value is less than 2560, it sets to 2560 and if passed value is greater than 3952, it sets to 3952. PARAMETERS Standard Parameters <maxdatamessage> - Maximum data message size. Optional Parameters Name of the stack on which this command is executed. <stack-name> -If not passed, the first stack configured in ShellExecutor will be used. EXAMPLES sccp set maxdatamessage 30000

7.4.3.2.2. Using GUI

On SCCP management page, click on pencil against the 'PreviewMode' property and text box becomes editable. Change value and save.

7.4.3.3. Preview Mode

7.4.3.3.1. Using CLI

You can set the 'previewmode' by issuing the command sccp set previewmode with appropriate parameters as described below. You can verify this by issuing the command sccp get previewmode which will display the value set for this property.

Name sccp set previewmode SYNOPSIS sccp set previewmode <true | false> stackname <stack-name> DESCRIPTION If set to true, stack only listens for incoming messages and does not send anything out of stack. Messages are silently dropped. PARAMETERS Standard Parameters <previewmode> - Set preview mode to true or false. **Optional Parameters** <stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used. **EXAMPLES** sccp set previewmode false

7.4.3.3.2. Using GUI

On SCCP management page, click on pencil against the 'PreviewMode' property and text box becomes editable. Change value and save.

7.4.3.4. Reassembly Timer Delay

7.4.3.4.1. Using CLI

You can set the 'reassemblytimerdelay' by issuing the command sccp set reassemblytimerdelay with appropriate parameters as described below. You can verify this by issuing the command sccp get reassemblytimerdelay which will display the value set for this property.

```
Name
   sccp set reassemblytimerdelay
SYNOPSIS
   sccp set reassemblytimerdelay <reassemblytimerdelay> stackname <stack-name>
DESCRIPTION
   Sets SCCP segmented message reassembling timeout (in milliseconds).
   Range is 10000 to 20000. If passed value is less than 10000, it sets to 10000 and
   if passed value is greater than 20000, it sets to 20000
PARAMETERS
   Standard Parameters
   <reassemblytimerdelay> - Re-assembly time delay in milliseconds
   Optional Parameters
                     Name of the stack on which this command is executed.
   <stack-name> -
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   sccp set reassemblytimerdelay 20000
```

7.4.3.4.2. Using GUI

On SCCP management page, click on pencil against the 'ReassemblyTimerDelay' property and text box becomes editable. Change value and save.

7.4.3.5. Remove Signaling Point Code

7.4.3.5.1. Using CLI

You can set the 'removespc' by issuing the command sccp set removespc with appropriate parameters as described below. You can verify this by issuing the command sccp get removespc which will display the value set for this property.

```
Name
   sccp get removespc
SYNOPSIS
   sccp get removespc stackname <stack-name>
DESCRIPTION
   Gets the value for removespc property.
PARAMETERS
   Optional Parameters
        <stack-name> - Name of the stack on which this command is executed.
        If not passed, the first stack configured in ShellExecutor
        will be used.
EXAMPLES
        sccp get removespc
```

7.4.3.5.2. Using GUI

On SCCP management page, click on pencil against the 'RemoveSpc' property and text box becomes editable. Change value and save.

7.4.3.6. SST Timer Duration Increase Factor

7.4.3.6.1. Using CLI

You can set the 'ssttimerduration_increasefactor' by issuing the command sccp set ssttimerduration_increasefactor with appropriate parameters as described below. You can verify this by issuing the command sccp get ssttimerduration_increasefactor which will display the value set for this property.

```
Name

sccp get ssttimerduration_increasefactor

SYNOPSIS

sccp get ssttimerduration_increasefactor stackname <stack-name>

DESCRIPTION

Gets the value for ssttimerduration_increasefactor property.

PARAMETERS

Optional Parameters

<stack-name> - Name of the stack on which this command is executed.

If not passed, the first stack configured in ShellExecutor

will be used.

EXAMPLES

sccp get ssttimerduration_increasefactor
```

7.4.3.6.2. Using GUI

On SCCP management page, click on pencil against the 'SstTimerDuration_IncreaseFactor' property and text box becomes editable. Change value and save.

7.4.3.7. SST Timer Duration Max

7.4.3.7.1. Using CLI

You can set the 'ssttimerduration_max' by issuing the command sccp set ssttimerduration_max with appropriate parameters as described below. You can verify this by issuing the command sccp get ssttimerduration_max which will display the value set for this property.

```
Name
   sccp get ssttimerduration_max
SYNOPSIS
   sccp get ssttimerduration_max stackname <stack-name>
DESCRIPTION
   Gets the value for ssttimerduration_max property.
PARAMETERS
   Optional Parameters
   <stack-name> - Name of the stack on which this command is executed.
        If not passed, the first stack configured in ShellExecutor
        will be used.
EXAMPLES
   sccp get ssttimerduration_max
```

7.4.3.7.2. Using GUI

On SCCP management page, click on pencil against the 'SstTimerDuration_Max' property and text box becomes editable. Change value and save.

7.4.3.8. SST Timer Duration Min

7.4.3.8.1. Using CLI

You can set the 'ssttimerduration_min' by issuing the command sccp set ssttimerduration_min with appropriate parameters as described below. You can verify this by issuing the command sccp get ssttimerduration_min which will display the value set for this property.

```
Name
   sccp get ssttimerduration_min
SYNOPSIS
   sccp get ssttimerduration_min stackname <stack-name>
DESCRIPTION
   Gets the value for ssttimerduration_min property.
PARAMETERS
   Optional Parameters
   <stack-name> - Name of the stack on which this command is executed.
        If not passed, the first stack configured in ShellExecutor
        will be used.
EXAMPLES
   sccp get ssttimerduration_min
```

7.4.3.8.2. Using GUI

On SCCP management page, click on pencil against the 'SstTimerDuration_Max' property and text box becomes editable. Change value and save.

7.4.3.9. ZMargin XUDT Message

7.4.3.9.1. Using CLI

You can set the 'zmarginxudtmessage' by issuing the command sccp set zmarginxudtmessage with appropriate parameters as described below. You can verify this by issuing the command sccp get zmarginxudtmessage which will display the value set for this property.

```
Name
   sccp get ssttimerduration_min
SYNOPSIS
   sccp get ssttimerduration_min stackname <stack-name>
DESCRIPTION
   Gets the value for ssttimerduration_min property.
PARAMETERS
   Optional Parameters
   <stack-name> - Name of the stack on which this command is executed.
        If not passed, the first stack configured in ShellExecutor
        will be used.
EXAMPLES
   sccp get ssttimerduration_min
```

7.4.3.9.2. Using GUI

On SCCP management page, click on pencil against the 'ZMarginXudtMessage' property and text box becomes editable. Change value and save.

7.4.4. View all Service Access Points (SAP)

7.4.4.1. Using CLI

You can view the details of all configured Service Access Points by issuing the command sccp sap show as described below:

Name sccp sap show
SYNOPSIS sccp sap show <id> stackname <stack-name></stack-name></id>
DESCRIPTION This command is used to view the details of all Service Access Points. If an <id> is specified, the command will only display the details of the SAP identified by the value of the 'id' specified.</id>
PARAMETERS
Optional Parameters
<id> - The id of the SAP whose details are to be displayed. If this parameter is not specified, the details of all defined SAPs will be displayed.</id>
<pre><stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.</stack-name></pre>

7.4.4.2. Using GUI

Navigate to the specific SCCP Management unit and switch to the 'SAP' tab. Here you can view a list of all the Service Access Points created. Every correctly configured Service Access Point will be displayed in a row with their defined values. The last column 'Action' will allow you to delete the Service Access Point.

7.4.5. Create a new Service Access Point

7.4.5.1. Using CLI

PARAMETERS

You can create a new Service Access Point by issuing the command sccp sap create with appropriate parameters as described below:

```
Name
sccp sap create
SYNOPSIS
sccp sap create <id> <mtp3-id> <opc> <ni> stackname <stack-name> networkid
<networkId>
localgtdigits <localGtDigits>
DESCRIPTION
This command is used to define a new Service Access Point.
```

Standard Parameters <id> The newly defined SAP will be identified using this 'id'. -This must be a unique number. Mtp3UserPart index - used as an index of 'mtp3UserPart' <mtp3-id> property of the SccpStack Bean. For each Mtp3UserPart, a sap must be configured. MTP Point code of the local signaling point. Takes an <opc> Integer Value. - Network indicator that forms part of the <ni> Service Information Octet (SIO). Optional Parameters <stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used. <networkId> - A digital parameter that means to which virtual SS7 network belongs Service Access Point (SAP). If this parameter is skipped - networkId will be set to "0" when SAP creation. Refer <xref linkend="design_multitenancy"/>. <localGtDigits> - Local GT digits. An incoming message will be brought to this sap if GT digits of callePartyAddress matches to this value. "null" value matches to any incoming message. If this parameter is skipped - networkId will be set to "null" by default. EXAMPLES sccp sap create 1 1 101 2 networkid 2 localgtdigits 999888777 The above command will create a new Service Access Point identified by the number '1'. The values for 'mtp3-id', 'opc' and 'ni' are 1, 101 and 2 respectively.

7.4.5.2. Using GUI

Procedure: Create a new Service Access Point using GUI

- 1. Navigate to the 'SAP' tab in the SCCP Management window and click on the 'Create SAP' button. This will launch a pop-up 'Create SAP'.
- 2. In the 'Create SAP' pop-up, add details of the new Service Access Point. You must ensure that you fill in all the mandatory parameters (Id, MTP3 Id, OPC, NI). For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new SAP will be created with

parameters as specified. If there is an error in creating the SAP then you will find the details of the error in the Management Console Log section below.

4. Click on the 'Close' button to close the 'Create SAP' pop-up.

7.4.6. Modify a Service Access Point

7.4.6.1. Using CLI

You can modify the values of a Service Access Point by issuing the command sccp sap modify with appropriate parameters as described below:

Name sccp sap modify SYNOPSIS sccp sap modify <id> <mtp3-id> <opc> <ni> stackname <stack-name> networkid <networkId> localgtdigits <localGtDigits> DESCRIPTION This command is used to modify a previously defined Service Access Point. PARAMETERS Standard Parameters <id> - The id of the SAP whose values are being modified. Mtp3UserPart index - used as an index of 'mtp3UserPart' <mtp3-id> property of the SccpStack Bean. For each Mtp3UserPart, a sap must be configured. MTP Point code of the local signaling point. Takes an <opc> -Integer Value. <ni> Network indicator that forms part of the Service Information Octet (SIO). **Optional Parameters** Name of the stack on which this command is executed. <stack-name> -If not passed, the first stack configured in ShellExecutor will be used. <networkId> - A digital parameter that means to which virtual SS7 network belongs Service Access Point (SAP). If this parameter is skipped - networkId will be set to "0" when SAP creation. Refer <xref linkend="design multitenancy"/>. <localGtDigits> - Local GT digits. An incoming message will be brought to this sap if GT digits of callePartyAddress matches to this value. "null" value matches to any incoming message. If this parameter is skipped - networkId will be set to "null" by default. EXAMPLES sccp sap modify 1 2 102 2 The above command will modify the values of the Service Access Point identified

by the number '1'. The new values for 'mtp3-id', 'opc' and 'ni' are 2, 102 and 2 respectively.

7.4.7. Delete a Service Access Point

7.4.7.1. Using CLI

You can delete a SAP by issuing the command sccp sap delete with appropriate parameters as described below:

Name sccp sap delete SYNOPSIS sccp sap delete <id> stackname <stack-name> DESCRIPTION This command is used to delete a previously defined Service Access Point. PARAMETERS Standard Parameters <id> The id of the SAP that is being deleted. -**Optional Parameters** <stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used. EXAMPLES sccp sap delete 1 The above command will delete the SAP identified by the number '1'.

7.4.7.2. Using GUI

Procedure: Delete a SAP using GUI

- 1. Navigate to the 'SAP' tab in the SCCP Management Unit window and locate the row corresponding to the SAP you wish to delete.
- 2. The last column for 'Delete' action will display a 'x' button in red and will be enabled.
- 3. Click on the red 'x' button to delete the corresponding SAP.

7.4.8. View all Destinations specified for a SAP

7.4.8.1. Using CLI

You can view the details of all Destinations specified for a Service Access Point by issuing the command sccp dest show as described below:

```
Name
   sccp dest show
SYNOPSIS
   sccp dest show <sap-id> <id> stackname <stack-name>
DESCRIPTION
   This command is used to view the details of all Destinations specified for a
   Service Access Point. If an <id> is specified in the command, it will only display
   the details of the Destination identified by the value of the 'id' specified.
PARAMETERS
   Standard Parameters
   <sap-id> - The id of the SAP whose Destination details are to be
                displayed.
   Optional Parameters
   <id>
                     The id of the Destination whose details are to be
                    displayed. If this parameter is not specified, the details
                    of all Destinations defined within the SAP 'sap-id' will
                    be displayed.
                     Name of the stack on which this command is executed.
   <stack-name> -
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
```

7.4.8.2. Using GUI

Navigate to the specific SCCP Management unit and switch to the 'SAP' tab. Here you can view a list of all the Service Access Points created. Every correctly configured Service Access Point will be displayed in a row with their defined values. To view the Destination details of a specific SAP, click on the row corresponding to the SAP. The row will expand below to display the details of all configured Destinations.

7.4.9. Define a new Destination for a SAP

7.4.9.1. Using CLI

You can define a new Destination for a Service Access Point by issuing the command sccp dest create with appropriate parameters as described below:

Name sccp dest create

SYNOPSIS

sccp dest create <sap-id> <id> <first-dpc> <last-dpc> <first-sls> <last-sls>
 <sls-mask> stackname <stack-name>

DESCRIPTION

This command is used to define a new Destination for a Service Access Point. For every SAP in the system, you should configure one or more Destinations.

PARAMETERS

Standard Parameters

- <id> An identifier for this newly created Destination. The number must be unique within each SAP.
- <first-dpc> The first value of the remote signaling point codes range.
- <last-dpc> The last value of the remote signaling point codes range. If the Destination specifies only a single Signaling Point Code, this value must be equal to the value specified for 'first-dpc'.
- <first-sls> The first value of the SLS range.
 SLS value range is from 0 to 255.
- <last-sls> The last value of the SLS range.
- <sls-mask> The mask value. SLS of a message will be exposed by
 performing a bitwise AND operation with this mask prior to
 comparing it with first-sls and last-sls values.

Optional Parameters

EXAMPLES

sccp dest create 1 1 201 201 0 7 7

The above command will create a new Destination (identified by number '1') for a Service Access Point identified by the number '1'. The values for 'first-dpc', 'last-dpc', 'first-sls', 'last-sls' and 'sls-mask' are 201, 201, 0, 7 and 7 respectively.

sccp dest create 2 1 300 399 0 255 255
The above command will create a new Destination (identified by number '2') for a Service Access Point identified by the number '1'. The values for 'first-dpc', 'last-dpc', 'first-sls', 'last-sls' and 'sls-mask' are 300, 399, 0, 255 and 255 respectively. This Destination will cover all possible SLS values. Therefore the value for first-sls =0, last-sls=255 and sls-mask=255

7.4.9.2. Using GUI

Procedure: Define a new Destination for a Service Access Point using GUI

- 1. Navigate to the 'SAP' tab in the SCCP Management window and click on the row corresponding to the SAP for which you would like to define a new Destination.
- 2. The SAP row will expand below to display the details of all configured Destinations. In this section for Destinations, click on the 'Create Destination' button. This will launch a new pop-up 'Create MTP3 Destination'.
- 3. In the 'Create MTP3 Destination' pop-up, add details of the new Destination being defined for the Service Access Point. You must ensure that you fill in all the mandatory parameters. For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 4. Verify the details entered and then click on the 'Create' button. A new Destination will be created with parameters as specified. If there is an error in creating the SAP then you will find the details of the error in the Management Console Log section below.
- 5. Click on the 'Close' button to close the 'Create MTP3 Destination' pop-up.

7.4.10. Modify a Destination defined for a SAP

7.4.10.1. Using CLI

You can modify the values of a Destination defined for a Service Access Point by issuing the command sccp dest modify with appropriate parameters as described below:

Name

sccp dest modify

SYNOPSIS

sccp dest modify <sap-id> <id> <first-dpc> <last-dpc> <first-sls> <last-sls>
 <sls-mask> stackname <stack-name>

DESCRIPTION

This command is used to modify the values of a Destination previously defined for a Service Access Point.

PARAMETERS

Standard Parameters

- <sap-id> The identifier of the SAP whose Destination is being modified.
- <id> The identifier of the Destination that is being modified.
- <first-dpc> The first value of the remote signaling point codes range.
- <last-dpc> The last value of the remote signaling point codes range. If the Destination specifies only a single Signaling Point Code, this value must be equal to the value specified for 'first-dpc'.
- <first-sls> The first value of the SLS range.
 SLS value range is from 0 to 255.
- <last-sls> The last value of the SLS range.
- <sls-mask> The mask value. SLS of a message will be exposed by
 performing a bitwise AND operation with this mask prior to
 comparing it with first-sls and last-sls values.

Optional Parameters

EXAMPLES

sccp dest modify 1 1 201 299 0 255 255

The above command will modify the values of the Destination identified by the number '1' within the Service Access Point identified by the number '1'. The new values for 'first-dpc', 'last-dpc', 'first-sls', 'last-sls' and 'sls-mask' are 201, 299, 0, 255 and 255 respectively.

7.4.11. Delete a Destination defined for a SAP

7.4.11.1. Using CLI

You can delete a Destination defined for a SAP by issuing the command sccp dest delete with appropriate parameters as described below:

```
Name
   sccp dest delete
SYNOPSIS
   sccp dest delete <sap-id> <id> stackname <stack-name>
DESCRIPTION
   This command is used to remove a previously defined Destination from a
   Service Access Point.
PARAMETERS
   Standard Parameters
   <sap-id> - The identifier of the SAP whose Destination is being
                deleted.
   <id>
                  The identifier of the Destination that is being
              _
                deleted.
   Optional Parameters
                     Name of the stack on which this command is executed.
   <stack-name> -
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   sccp dest delete 1 1
   The above command will delete the Destination identified by the number '1' from
   the SAP identified by the number '1'.
```

7.4.11.2. Using GUI

Procedure: Delete a Destination defined for a SAP using GUI

- 1. Navigate to the 'SAP' tab in the SCCP Management Unit window and click on the row corresponding to the SAP from which you wish to delete a Destination.
- 2. The SAP row will expand below to display the details of all configured Destinations. In this section for Destinations, locate the specific Destination you wish to remove from the list.
- 3. In the row corresponding to the identified Destination, click on the red 'x' button in the actions column to delete that Destination.

7.4.12. View all configured SCCP Addresses

7.4.12.1. Using CLI

You can view the details of all configured SCCP Addresses by issuing the command sccp address show as described below:

Name sccp address show SYNOPSIS sccp address show id <id> stackname <stack-name> DESCRIPTION This command is used to view the details of all configured addresses. If an <id> is specified in the command, it will only display the details of the Address identified by the value of the 'id' specified. PARAMETERS **Optional Parameters** The id of the Address whose details are to be displayed. <id> -If this parameter is not specified, the details of all configured Addresses will be displayed. Name of the stack on which this command is executed. <stack-name> -If not passed, the first stack configured in ShellExecutor will be used.

7.4.12.2. Using GUI

Navigate to the specific SCCP Management unit and switch to the 'Address' tab. Here you can view a list of all the configured Addresses. Every correctly configured Address will be displayed in a row along with the defined values.

7.4.13. Create a new Primary/Backup address

7.4.13.1. Using CLI

You can create a new primary address or backup address of translation by issuing the command sccp address create with appropriate parameters as described below:

```
Name
sccp address create
SYNOPSIS
sccp address create <id> <address-indicator> <point-code> <subsystem-number>
<translation-type> <numbering-plan> <nature-of-address-indicator> <digits>
```

stackname <stack-name> DESCRIPTION This command is used to create a new primary address or backup address of

translation. You can create a new newCallingParty address as well using this command. The global title address information of this command is combined with

the global title being translated by examining the mask provided in the 'sccp rule create' command.

PARAMETERS

Standard Parameters

<id>

- A unique number to identify this address.

<address-indicator> - The address indicator is the first field in a SCCP
Party Address (called/calling) and is one octet in
length. Its function is to indicate which
information elements are present so that the
address can be interpreted. In other words, it
indicates the type of addressing information that
is to be found in the address field. The
addressing information from the original global
title is then compared with the passed address
information to match the rule.

SCCP ADDRESS INDICATOR

| 8 | 7 | 6 | 5 | 4 |3 | 2 | 1 |

- Bit '1' : PC Indicator (1 = included)
- Bit '2' : SSN Indicator (1 = included)
 - Bit '3 6' : GT Indicator (0000 = GT not included) (0001 = GT includes Nature of Address) (0010 = GT includes Translation Type) (0011 = GT includes Translation Type, Numbering Plan and Encoding Scheme) (0100 = GT includes Translation Type, Numbering Plan and

Encoding Scheme and Nature of Address) : Routing Indicator Bit '7' (0 = Route on GT,1 = Route on PC + SSNBit '8' : Reserved for National use. Only two fields of Address Indicator is used now for GTT: - GT Indicator (this is used for GlobalTitle type that will be created) - Routing Indicator bit (0 = Route on GT, 1 = Route on PC + SSN) GT Indicator for ITU-T network that is mostly used is -0100 (GT includes Translation Type, Numbering Plan and Encoding Scheme and Nature of Address). Digital value for it is - 16. For 0100 GT Indicator we will use two possible values: 16 - 0100 GT Indicator and Route on GT 80 - 0100 GT Indicator and Route on PC + SSN Even when SCCP stack works in ANSI mode Address Indicator value for CLI and GUI must have values that we use for TTU-T mode. - MTP Signaling Point Code. <point-code> This parameter contains a point code to which message will be routed after GTT (DPC field). This parameter is mandatory. <subsystem-number> - This parameter contains SSN which will be placed into CalledPartyAddress. If you set this parameter to "0", SSN from CalledPartyAddress of an original message will be put into CalledPartyAddress. <translation-type> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description 0 Unknown 1 - 63 International Service 64 - 127 Spare 128 - 254 National Network Specific 255 Reserved for Expansion

	Value of this parameter will be placed into CalledPartyAddress. This parameter is mandatory if GT Indicator suppose this parameter is included into GT. Most used value: 0 - translation-type - Unknown
<numbering-plar< td=""><td>- The Number Plan (NP) field specifies the numbering plan which the address information follows. This is ignored if GT Indicator is 0000, 0001 or 0010.</td></numbering-plar<>	- The Number Plan (NP) field specifies the numbering plan which the address information follows. This is ignored if GT Indicator is 0000, 0001 or 0010.
	Value of this parameter will be placed into CalledPartyAddress. This parameter is mandatory if GT Indicator suppose this parameter is included into GT. Most used value: 1 - numbering-plan - ISDN/telephony
<nature-of-addr< td=""><td>ess> - The Nature of Address Indicator (NAI) field defines the address range for a specific numbering plan. This is only used if GT Indicator is 0100.</td></nature-of-addr<>	ess> - The Nature of Address Indicator (NAI) field defines the address range for a specific numbering plan. This is only used if GT Indicator is 0100.
	Value of this parameter will be placed into CalledPartyAddress. This parameter is mandatory if GT Indicator suppose this parameter is included into GT. Most used value: 4 - nature-of-address - International
<digits> -</digits>	The global title address information to translate to. Specified as string of digits divided into subsections using separator '/' depending on if the mask contains separator or not. The digits string can contain:
	DIGIT PATTERN
	Value Description
	- padding - ignored
	<pre>/ separator used to split the digit pattern into sections. Each section is processed differently as specified by the mask parameter in the 'sccp rule create' command.</pre>
	We need this parameter if at least one section of Rule mask contains "R" (replace) value. Else set this field to "0". If this field is needed it should contain the same subsections as the rule mask has.
Optional Parame	ters
<stack-name> -</stack-name>	Name of the stack on which this command is executed.

```
will be used.
```

EXAMPLES

sccp address create 1 71 2 8 0 0 3 123456789

7.4.13.2. Using GUI

Procedure: Create a new Primary/Backup Address using GUI

- 1. Navigate to the 'Address' tab in the SCCP Management window and click on the 'Create Address' button. This will launch a new pop-up 'Create SCCP Address'.
- 2. In the 'Create SCCP Address' pop-up, add details of the new SCCP Address being defined. You must ensure that you fill in all the mandatory parameters. For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new Address will be created with parameters as specified. If there is an error in creating the Address then you will find the details of the error in the Management Console Log section below.
- 4. Click on the 'Close' button to close the 'Create SCCP Address' pop-up.

7.4.14. Modify a Primary/Backup Address

7.4.14.1. Using CLI

You can modify the values of a primary address or backup address of translation by issuing the command sccp address modify with appropriate parameters as described below:

```
Name
    sccp address modify
SYNOPSIS
    sccp address modify <id> <address-indicator> <point-code> <subsystem-number>
    <translation-type> <numbering-plan> <nature-of-address-indicator> <digits>
    stackname <stack-name>
DESCRIPTION
    This command is used to modify the values of an address
    previously defined.
PARAMETERS
    Standard Parameters
    <id>
                      Identifier of the address to be modified.
                              The address indicator is the first field in a SCCP
    <address-indicator>
                    Party Address (called/calling) and is one octet in
                    length. Its function is to indicate which
                    information elements are present so that the
                    address can be interpreted. In other words, it
```

<pre>indicates the type of addressing information that is to be found in the address field. The addressing information from the original global title is then compared with the passed address information to match the rule. SCCP ADDRESS INDICATOR </pre>
SCCP ADDRESS INDICATOR
<pre>Bit '1' : PC Indicator (1 = included) Bit '2' : SSN Indicator (1 = included) Bit '3 - 6' : GT Indicator (0000 = GT not included) (0001 = GT includes Nature of Address) (0010 = GT includes Translation Type) (0011 = GT includes Translation Type, Numbering Plan and Encoding Scheme) (0100 = GT includes Translation Type, Numbering Plan and Encoding Scheme and Nature of Address) Bit '7' : Routing Indicator (0 = Route on GT, 1 = Route on PC + SSN) Bit '8' : Reserved for National use.</pre>
<pre>Bit '1' : PC Indicator (1 = included) Bit '2' : SSN Indicator (1 = included) Bit '3 - 6' : GT Indicator (0000 = GT not included) (0001 = GT includes Nature of Address) (0010 = GT includes Translation Type) (0011 = GT includes Translation Type, Numbering Plan and Encoding Scheme) (0100 = GT includes Translation Type, Numbering Plan and Encoding Scheme and Nature of Address) Bit '7' : Routing Indicator (0 = Route on GT, 1 = Route on PC + SSN) Bit '8' : : Reserved for National use.</pre>
<pre>Bit '2' : SSN Indicator (1 = included) Bit '3 - 6' : GT Indicator (0000 = GT not included) (0001 = GT includes Nature of Address) (0010 = GT includes Translation Type) (0011 = GT includes Translation Type, Numbering Plan and Encoding Scheme) (0100 = GT includes Translation Type, Numbering Plan and Encoding Scheme and Nature of Address) Bit '7' : Routing Indicator (0 = Route on GT, 1 = Route on PC + SSN) Bit '8' : Reserved for National use.</pre>
<pre>Bit '3 - 6' : GT Indicator (0000 = GT not included) (0001 = GT includes Nature of Address) (0010 = GT includes Translation Type) (0011 = GT includes Translation Type, Numbering Plan and Encoding Scheme) (0100 = GT includes Translation Type, Numbering Plan and Encoding Scheme and Nature of Address) Bit '7' : Routing Indicator (0 = Route on GT, 1 = Route on PC + SSN) Bit '8' : Reserved for National use.</pre>
Bit '7' : Routing Indicator (0 = Route on GT, 1 = Route on PC + SSN) Bit '8' : Reserved for National use.
Bit '8' : Reserved for National use.
<pre>Only two fields of Address Indicator is used now for GTT: - GT Indicator (this is used for GlobalTitle type that will be created) - Routing Indicator bit (0 = Route on GT, 1 = Route on PC + SSN) GT Indicator for ITU-T network that is mostly used is - 0100 (GT includes Translation Type, Numbering Plan and Encoding Scheme and Nature of Address). Digital value for it is - 16. For 0100 GT Indicator we will use two possible values: 16 - 0100 GT Indicator and Route on GT 80 - 0100 GT Indicator and Route on PC + SSN</pre>

Even when SCCP stack works in ANSI mode Address Indicator value for CLI and GUI must have values that we use for ITU-T mode. MTP Signaling Point Code. <point-code> -This parameter contains a point code to which message will be routed after GTT (DPC field). This parameter is mandatory. <subsystem-number> - This parameter contains SSN which will be placed into CalledPartyAddress. If you set this parameter to "0", SSN from CalledPartyAddress of an original message will be put into CalledPartyAddress. <translation-type> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description -----0 Unknown 1 - 63 International Service 64 - 127 Spare 128 - 254 National Network Specific 255 Reserved for Expansion Value of this parameter will be placed into CalledPartyAddress. This parameter is mandatory if GT Indicator suppose this parameter is included into GT. Most used value: 0 - translation-type - Unknown - The Number Plan (NP) field specifies the numbering <numbering-plan> plan which the address information follows. This is ignored if GT Indicator is 0000, 0001 or 0010. Value of this parameter will be placed into CalledPartyAddress. This parameter is mandatory if GT Indicator suppose this parameter is included into GT. Most used value: 1 - numbering-plan - ISDN/telephony <nature-of-address> - The Nature of Address Indicator (NAI) field defines the address range for a specific numbering plan. This is only used if GT Indicator is 0100. Value of this parameter will be placed into CalledPartyAddress. This parameter is mandatory if GT Indicator suppose this parameter is included into GT.

Most used value: 4 - nature-of-address - International <digits> The global title address information to translate to. Specified as string of digits divided into subsections using separator '/' depending on if the mask contains separator or not. The digits string can contain: DIGIT PATTERN Value Description _____ padding - ignored / separator used to split the digit pattern into sections. Each section is processed differently as specified by the mask parameter in the 'sccp rule create' command. We need this parameter if at least one section of Rule mask contains "R" (replace) value. Else set this field to "0". If this field is needed it should contain the same subsections as the rule mask has. **Optional Parameters** <stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.

7.4.15. Delete a Primary/Backup Address

7.4.15.1. Using CLI

You can delete a Primary or Backup Address by issuing the command sccp address delete with appropriate parameters as described below:

```
Name
    sccp address delete
SYNOPSIS
    sccp address delete <id> stackname <stack-name>
DESCRIPTION
    This command is used to remove previously defined addresses.
PARAMETERS
    Standard Parameters
    <id>
                 The identifier of the address that is being deleted.
             -
    Optional Parameters
                     Name of the stack on which this command is executed.
    <stack-name> -
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   sccp address delete 1
    The above command will delete the address identified by the number '1'.
```

7.4.15.2. Using GUI

Procedure: Delete a Primary/Backup Address using GUI

- 1. Navigate to the 'Address' tab in the SCCP Management Unit window and locate the row corresponding to the Address you wish to delete.
- 2. In the row corresponding to the identified Address, click on the red 'x' button in the actions column to delete that Address.

7.4.16. View all configured SCCP Rules

7.4.16.1. Using CLI

You can view the details of all configured SCCP Rules by issuing the command sccp rule show as described below:

Name sccp rule show
SYNOPSIS sccp rule show id <id> stackname <stack-name></stack-name></id>
DESCRIPTION This command is used to view the details of all Rules configured. If an <id> is specified in the command, it will only display the details of the Rule identified by the value of the 'id' specified.</id>
PARAMETERS
Optional Parameters
<id> - The id of the Rule whose details are to be displayed. If this parameter is not specified, the details of all configured Rules will be displayed.</id>
<stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.</stack-name>

7.4.16.2. Using GUI

Navigate to the specific SCCP Management unit and switch to the 'Rules' tab. Here you can view a list of all the configured Rules. Every correctly configured Rule will be displayed in a row along with the defined values.

7.4.17. Create a new SCCP Rule

7.4.17.1. Sorting Algorithm

When you define Rules, a comparison function imposes ordering the collection of SCCP Rules using a sorting algorithm that is based on the GT digits. The algorithm is defined below:

1. Rules defined with OriginationType==localOriginated or OriginationType==remoteOriginated, are always at the top of the list. Rules defined with OriginationType==All are always at the bottom of the list.

Among rules with the same values for OriginationType (All or localOriginated/remoteOriginated), the sorting is done using the below rules.

- 2. Rules with GT digits having no wildcard (* or ?) are always at the top of the list. Between two Rules with GT digits, both having no wildcards, the one with the shortest length is at the top of the list. For example, Digit1 "123456" will be above Digit2 "1234567890" and this will be above Digit3 "999/*
- 3. Rules with GT digits having the wildcard "?" are always above digits having the wildcard "*". For example, Digit1 "800/????/9" will be above Digit2 "999/*

- 4. Between Rules with two GT digits both having wildcard "?", the one with the least number of wildcard "?" is at the top of the list. For example, Digit1 "800/????/9" will be above Digit2 "800/????/9"
- 5. Between Rules with two GT digits both having an equal number of wildcard "?", the digit whose first appearance of "?" is after other, is at the top of the list. For example between Digit1 "80/??/0/???/9" and Digit 2 "800/????/9", Digit2 is above Digit1.

When a Rule is compared during Translation, comparison always starts from the top of the list.

7.4.17.2. Using CLI

You can create a new Rule by issuing the command sccp rule create with appropriate parameters as described below:

Na	me		
	sccp rule create		
SI	SYNOPSIS sccp rule create <id> <mask> <address-indicator> <point-code> <subsystem-number> <translation-type> <numbering-plan> <nature-of-address-indicator> <digits> <ruletype> <primary-address-id> backup-addressid <backup-address-id> loadsharing-algo <loadsharing-algorithm> newcgparty-addressid <new-callingpartyaddress-id> origination-type <originationtype> stackname <stack-name> networkid <networkid></networkid></stack-name></originationtype></new-callingpartyaddress-id></loadsharing-algorithm></backup-address-id></primary-address-id></ruletype></digits></nature-of-address-indicator></numbering-plan></translation-type></subsystem-number></point-code></address-indicator></mask></id>		
DE	DESCRIPTION This command is used to create a new SCCP Routing Rule. You must ensure that primary and backup addresses are configured properly prior to executing this command.		
PA	RAMETERS		
	Standard Parameters		
	<id> - A unique number to identify this Rule.</id>		
	<mask></mask>	 A mask defines which part of the originally dialed digits remains in the translated digits and which part is replaced by the digits from primary or backup address. A mask is divided into sections by separator '/'. The number of sections in a mask should be equal to the sections in digits passed in this command and the sections in primary or backup address. This paramter is mandatory. MASK DEFINITIONS 	
		- Ignore	

/	Separator used to split the mask into sections.
K	Retain the original dialed digits of this section in the translated digits.
R	Replace the original dialed digits of this section with the same section from primary or backup address in the translated digits.
<address-indicato P l i a i a t i i</address-indicato 	The address indicator is the first field in a SCCP rty Address (called/calling) and is one octet in ngth. Its function is to indicate which formation elements are present so that the dress can be interpreted. In other words, it dicates the type of addressing information that to be found in the address field. The dressing information from the original global tle is then compared with the passed address formation to match the rule.
S - -	CP ADDRESS INDICATOR 8 7 6 5 4 3 2 1
В	t '1' : PC Indicator (1 = included)
В	t '2' : SSN Indicator (1 = included)
В	t '3 - 6' : GT Indicator (0000 = GT not included) (0001 = GT includes Nature of Address) (0010 = GT includes Translation Type) (0011 = GT includes Translation Type, Numbering Plan and Encoding Scheme) (0100 = GT includes Translation Type, Numbering Plan and Encoding Scheme and Nature of Address)

	Bit '7' : Routing Indicator (0 = Route on GT, 1 = Route on PC + SSN)
	Bit '8' : Reserved for National use.
	Only GT Indicator is used in the current implementation. A Rule matches to an original address only if GT Indicator from address-indicator is the same in a rule and in an original address. GT Indicator for ITU-T network that is mostly used is - 0100 (GT includes Translation Type, Numbering Plan and Encoding Scheme and Nature of Address). If you also use 0100 - use digital value for it - 16. Even when SCCP stack works in ANSI mode Address Indicator value for CLI and GUI must have values that we use for ITU-T mode.
<point-code></point-code>	- MTP Signaling Point Code. This is ignored if Bit '0' of address-indicator is not set. This parameter is not used in currentimplemetation and can be set to "0".
<subsystem-numb< td=""><td>per> - This is ignored if Bit '1' of address-indicator is not set. This parameter is not used in currentimplemetation and can be set to "0".</td></subsystem-numb<>	per> - This is ignored if Bit '1' of address-indicator is not set. This parameter is not used in currentimplemetation and can be set to "0".
<translation-ty< td=""><td>pe> - This is ignored if GT Indicator is 0000 or 0001.</td></translation-ty<>	pe> - This is ignored if GT Indicator is 0000 or 0001.
<translation-ty< td=""><td>rpe> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES</td></translation-ty<>	rpe> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES
<translation-ty< td=""><td>rpe> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description</td></translation-ty<>	rpe> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description
<translation-ty< td=""><td><pre> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description 0 Unknown</pre></td></translation-ty<>	<pre> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description 0 Unknown</pre>
<translation-ty< td=""><td><pre> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description 0 Unknown 1 - 63 International Service</pre></td></translation-ty<>	<pre> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description 0 Unknown 1 - 63 International Service</pre>
<translation-ty< td=""><td><pre>- This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description 0 Unknown 1 - 63 International Service 64 - 127 Spare</pre></td></translation-ty<>	<pre>- This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description 0 Unknown 1 - 63 International Service 64 - 127 Spare</pre>
<translation-ty< td=""><td><pre>rpe> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description 0 Unknown 1 - 63 International Service 64 - 127 Spare 128 - 254 National Network Specific</pre></td></translation-ty<>	<pre>rpe> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description 0 Unknown 1 - 63 International Service 64 - 127 Spare 128 - 254 National Network Specific</pre>
<translation-ty< td=""><td><pre>rpe> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description </pre></td></translation-ty<>	<pre>rpe> - This is ignored if GT Indicator is 0000 or 0001. TRANSLATION TYPE VALUES Value Description </pre>

<numbering-plan> - The Number Plan (NP) field specifies the numbering plan which the address information follows. This is ignored if GT Indicator is 0000, 0001 or 0010. NUMBER PLAN VALUES Value Description _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ 0 Unknown 1 ISDN/Telephony Number Plan (Recommendations E.163 and E.164) 2 Generic Numbering Plan 3 Data Numbering Plan (Recommendations X.121) 4 Telex Numbering Plan (Recommendations F.69) 5 Maritime Mobile Numbering Plan (Recommendations E.210, E.211) 6 Land Mobile Numbering Plan (Recommendations E.212) 7 ISDN/Mobile Numbering Plan (Recommendations E.214) 8 to 13 Spare Private Network or 14 Network-Specific Numbering Plan 15 Reserved This paramter is mandatory. A Rule matches to an original address only if a value of this parameter is the same in a rule and in an original address. Values are compared only if GT type contains this parameter (see GT Indicator description in <address-indicator> parameter). Most used values: 1 - numbering-plan - ISDN/telephony <nature-of-address> -The Nature of Address Indicator (NAI) field defines the address range for a specific numbering plan. This is only used if GT Indicator is 0100.

	NAI VAI	LUES
	Value	Description
	0	Unknown
	1	Subscriber Number
	2	Reserved for National use
	3	National Significant Number
	4	International Number
	5 to 12	27 Spare
	This pa A Rule this pa address paramet <address Most us 4 - nat</address 	aramter is mandatory. matches to an original address only if a value of arameter is the same in a rule and in an original s. Values are compared only if GT type contains this ter (see GT Indicator description in ss-indicator> parameter). sed values: ture-of-address - International
<digits> -</digits>	Spect subsect the mas digits rule sp	ifies the string of digits divided into tions using separator '/' depending on if sk contains separator or not. The dialed should match with theses digits as per the pecified below:
	DIGIT A	PATTERN
	Value	Description
	-	padding – ignored
	*	wildcard - matches any number of digits
	?	wildcard - matches exactly one digit
	/	separator used to split the digit pattern into sections. Each section can be processed differently as specified by the mask parameter.
	This pa	arameter is mandatory. It should contain the same tions count as the rule mask has.

<ruletype></ruletype>	- Takes one of the following values defined below.
	RULE TYPE VALUES
	Value Description
	solitary Only one (primary) address is used for routing. (<backup-address-id> may be missed in this case).</backup-address-id>
	dominant Both primary and backup addresses are used and mandatory. If both the addresses are available, the primary address is used for routing.
	loadshared Both primary and backup addresses are used and mandatory. If both the addresses are available, either primary or backup address is used for routing. The <loadsharing-algorithm> should be configured in this case.</loadsharing-algorithm>
	broadcast Both primary and backup addresses are used and are mandatory. All messages are routed to both addresses.
<primary-addres< td=""><td>s-id> - Identifies the SCCP Address used as the primary translation.</td></primary-addres<>	s-id> - Identifies the SCCP Address used as the primary translation.
Optional Parame	ters
<backup-address< td=""><td>s-id> - Identifies the SCCP Address used as the backup translation in case the pointcode specified by the primary address is not available. Backup address is used if <ruletype> is not "solitary".</ruletype></td></backup-address<>	s-id> - Identifies the SCCP Address used as the backup translation in case the pointcode specified by the primary address is not available. Backup address is used if <ruletype> is not "solitary".</ruletype>
<loadsharing-al< td=""><td>gorithm> - This parameter is mandatory if <ruletype> is "loadshared". The Loadsharing algorithm is configured here. Possible values of the parameter are:</ruletype></td></loadsharing-al<>	gorithm> - This parameter is mandatory if <ruletype> is "loadshared". The Loadsharing algorithm is configured here. Possible values of the parameter are:</ruletype>
	LOAD SHARING ALGORITHM VALUES
	Value Description

bit4 if((SLS & 0x10) == 0) <route to primary> else <route to backup> This algorithm is the best if all traffic is local (mobicents stack) originated bit3 if((SLS & 0x08) == 0)<route to primary> else <route to backup> This algorithm can be used if not all traffic is local (mobicents stack) originated. But only 8 links are acceptable in both linksets. if((SLS & 0x04) == 0) bit2 <route to primary> else <route to backup> This algorithm can be used if not all traffic is local (mobicents stack) originated. But only 8 links are acceptable in both linksets. if((SLS & 0x02) == 0) bit1 <route to primary> else <route to backup> This algorithm can be used if not all traffic is local (mobicents stack) originated. But only 8 links are acceptable in both linksets. bit0 if((SLS & 0x01) == 0) <route to primary> else <route to backup> This algorithm can be used if not all traffic is local (mobicents stack) originated. But only 8 links are acceptable in both linksets. <new-callingPartyAddress-id> This address will replace the callingPartyAddresses of messages that fit a Rule. <originationType> - Takes one of the following values defined below. If the parameter is not defined, rule applies to

all messages regardless of their origination. ORIGINATION TYPE VALUES Value Description localOriginated If this parameter is "localOriginated", then a rule applies only for messages originating from local SCCP users (for example a local TCAP stack). remoteOriginated If this parameter is "remoteOriginated", then a rule applies only for messages originating from SS7 network and not for messages originating from local SCCP users. Name of the stack on which this command is executed. <stack-name> -If not passed, the first stack configured in ShellExecutor will be used. <networkId> - A digital parameter that means to which virtual SS7 network belongs a Rule. If this parameter is skipped - networkId will be set to "0" when a Rule creation. Refer xref linkend="design_multitenancy"/>. **EXAMPLES** sccp rule create 1 R 71 2 8 0 0 3 123456789 solitary 1 sccp rule create 2 R 71 2 8 0 0 3 123456789 dominant 1 1 sccp rule create 2 R 71 2 8 0 0 3 123456789 loadshared 1 1 bit4

7.4.17.3. Using GUI

Procedure: Create a new Rule using GUI

- 1. Navigate to the 'Rules' tab in the SCCP Management window and click on the 'Create Rule' button. This will launch a new pop-up 'Create Rule'.
- 2. In the 'Create Rule' pop-up, add details of the new SCCP Rule being defined. You must ensure that you fill in all the mandatory parameters. For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new Rule will be created with parameters as specified. If there is an error in creating the Rule then you will find the details of the error in the Management Console Log section below.

4. Click on the 'Close' button to close the 'Create Rule' pop-up.

7.4.18. Modify a SCCP Rule

7.4.18.1. Using CLI

You can modify the values of a Rule by issuing the command sccp rule modify with appropriate parameters as described below:

```
Name
   sccp rule modify
SYNOPSTS
   sccp rule modify <id> <mask> <address-indicator> <point-code> <subsystem-number>
   <translation-type> <numbering-plan> <nature-of-address-indicator> <digits>
   <ruleType> <primary-address-id> backup-addressid <backup-address-id>
   loadsharing-algo <loadsharing-algorithm> newcgparty-addressid
   <new-callingPartyAddress-id> origination-type <originationType>
   stackname <stack-name> networkid <networkId>
DESCRIPTION
   This command is used to modify the values of a SCCP Route previously defined.
PARAMETERS
   Standard Parameters
   <id>
                 - A unique number to identify this Rule.
   <mask>
                         A mask defines which part of the originally dialed
                     -
                   digits remains in the translated digits and which
                   part is replaced by the digits from primary or
                   backup address. A mask is divided into sections by
                   separator '/'. The number of sections in a mask
                   should be equal to the sections in digits passed
                   in this command and the sections in primary or
                   backup address. This paramter is mandatory.
                   MASK DEFINITIONS
                   Mnemonic Function
                   -----
                           Ignore
                   /
                           Separator used to split the mask
                           into sections.
                           Retain the original dialed digits
                   К
                           of this section in the translated
                           digits.
```

	R Replace the original dialed digits of this section with the same section from primary or backup address in the translated digits.
<address-indica< td=""><td>tor> - The address indicator is the first field in a SCCP Party Address (called/calling) and is one octet in length. Its function is to indicate which information elements are present so that the address can be interpreted. In other words, it indicates the type of addressing information that is to be found in the address field. The addressing information from the original global title is then compared with the passed address information to match the rule.</td></address-indica<>	tor> - The address indicator is the first field in a SCCP Party Address (called/calling) and is one octet in length. Its function is to indicate which information elements are present so that the address can be interpreted. In other words, it indicates the type of addressing information that is to be found in the address field. The addressing information from the original global title is then compared with the passed address information to match the rule.
	SCCP ADDRESS INDICATOR
	8 7 6 5 4 3 2 1
	Bit '1' : PC Indicator (1 = included)
	Bit '2' : SSN Indicator (1 = included)
	Bit '3 - 6' : GT Indicator (0000 = GT not included) (0001 = GT includes Nature of Address) (0010 = GT includes Translation Type) (0011 = GT includes Translation Type, Numbering Plan and Encoding Scheme) (0100 = GT includes Translation Type, Numbering Plan and Encoding Scheme and Nature of Address)
	Bit '7' : Routing Indicator (0 = Route on GT, 1 = Route on PC + SSN)
	Bit '8' : Reserved for National use.
	Only GT Indicator is used in the current implementation.

	A Rule matches to an original address only if GT Indicator from address-indicator is the same in a rule and in an original address. GT Indicator for ITU-T network that is mostly used is - 0100 (GT includes Translation Type, Numbering Plan and Encoding Scheme and Nature of Address). If you also use 0100 - use digital value for it - 16. Even when SCCP stack works in ANSI mode Address Indicator value for CLI and GUI must have values that we use for ITU-T mode.
<point-code></point-code>	- MTP Signaling Point Code. This is ignored if Bit '0' of address-indicator is not set. This parameter is not used in currentimplemetation and can be set to "0".
<subsystem-numb< td=""><td>er> - This is ignored if Bit '1' of address-indicator is not set. This parameter is not used in currentimplemetation and can be set to "0".</td></subsystem-numb<>	er> - This is ignored if Bit '1' of address-indicator is not set. This parameter is not used in currentimplemetation and can be set to "0".
<translation-ty< td=""><td>pe> - This is ignored if GT Indicator is 0000 or 0001.</td></translation-ty<>	pe> - This is ignored if GT Indicator is 0000 or 0001.
	TRANSLATION TYPE VALUES
	Value Description
	0 Unknown
	1 - 63 International Service
	64 - 127 Spare
	128 - 254 National Network Specific
	255 Reserved for Expansion
	This paramter is mandatory. A Rule matches to an original address only if a value of this parameter is the same in a rule and in an original address. Values are compared only if GT type contains this parameter (see GT Indicator description in <address-indicator> parameter). Most used values: 0 - translation-type - Unknown</address-indicator>
<numbering-plan< td=""><td>> The Number Plan (NP) field specifies the numbering plan which the address information follows. This is ignored if GT Indicator is 0000, 0001 or 0010.</td></numbering-plan<>	> The Number Plan (NP) field specifies the numbering plan which the address information follows. This is ignored if GT Indicator is 0000, 0001 or 0010.
	NUMBER PLAN VALUES

	Value	Description
	0	Unknown
	1	ISDN/Telephony Number Plan (Recommendations E.163 and E.164)
	2	Generic Numbering Plan
	3	Data Numbering Plan (Recommendations X.121)
	4	Telex Numbering Plan (Recommendations F.69)
	5	Maritime Mobile Numbering Plan (Recommendations E.210, E.211)
	6	Land Mobile Numbering Plan (Recommendations E.212)
	7	ISDN/Mobile Numbering Plan (Recommendations E.214)
	8 to 13	Spare
	14	Private Network or Network-Specific Numbering Plan
	15	Reserved
	This par A Rule r this par address paramete <address Most use 1 - numb</address 	ramter is mandatory. matches to an original address only if a value of rameter is the same in a rule and in an original . Values are compared only if GT type contains this er (see GT Indicator description in s-indicator> parameter). ed values: pering-plan - ISDN/telephony
<nature-of-addre< th=""><td>ess> - defines plan. Th</td><td>The Nature of Address Indicator (NAI) field the address range for a specific numbering nis is only used if GT Indicator is 0100.</td></nature-of-addre<>	ess> - defines plan. Th	The Nature of Address Indicator (NAI) field the address range for a specific numbering nis is only used if GT Indicator is 0100.
	NAI VALU	JES
	Value	Description
	0	Unknown
	1	Subscriber Number

	2 Reserved for National use
	3 National Significant Number
	4 International Number
	5 to 127 Spare
	This paramter is mandatory. A Rule matches to an original address only if a value of this parameter is the same in a rule and in an original address. Values are compared only if GT type contains this parameter (see GT Indicator description in <address-indicator> parameter). Most used values: 4 - nature-of-address - International</address-indicator>
<digits></digits>	 Specifies the string of digits divided into subsections using separator '/' depending on if the mask contains separator or not. The dialed digits should match with theses digits as per the rule specified below:
	DIGIT PATTERN
	Value Description
	- padding - ignored
	 wildcard - matches any number of digits
	? wildcard - matches exactly one digit
	<pre>/ separator used to split the digit pattern into sections. Each section can be processed differently as specified by the mask parameter.</pre>
	This parameter is mandatory. It should contain the same subsections count as the rule mask has.
<ruletype></ruletype>	- Takes one of the following values defined below.
	RULE TYPE VALUES
	Value Description

solitary Only one (primary) address is used for routing. (<backup-address-id> may be missed in this case). Both primary and backup dominant addresses are used and mandatory. If both the addresses are available, the primary address is used for routing. loadshared Both primary and backup addresses are used and mandatory. If both the addresses are available, either primary or backup address is used for routing. The <loadsharing-algorithm> should be configured in this case. broadcast Both primary and backup addresses are used and are mandatory. All messages are routed to both addresses. <primary-address-id> - Identifies the SCCP Address used as the primary translation. **Optional Parameters** <backup-address-id> - Identifies the SCCP Address used as the backup translation in case the pointcode specified by the primary address is not available. Backup address is used if <ruleType> is not "solitary". <loadsharing-algorithm> - This parameter is mandatory if <ruleType> is "loadshared". The Loadsharing algorithm is configured here. Possible values of the parameter are: LOAD SHARING ALGORITHM VALUES Value Description _____ bit4 if((SLS & 0x10) == 0)<route to primary> else <route to backup> This algorithm is the best if all traffic is local (mobicents stack) originated

bit3 if((SLS & 0x08) == 0) <route to primary> else <route to backup> This algorithm can be used if not all traffic is local (mobicents stack) originated. But only 8 links are acceptable in both linksets. <new-callingPartyAddress-id> This address will replace the callingPartyAddresses of messages that fit a Rule. <originationType> - Takes one of the following values defined below. If the parameter is not defined, rule applies to all messages regardless of their origination. ORIGINATION TYPE VALUES Value Description localOriginated If this parameter is "localOriginated", then a rule applies only for messages originating from local SCCP users (for example a local TCAP stack). remoteOriginated If this parameter is "remoteOriginated", then a rule applies only for messages originating from SS7 network and not for messages originating from local SCCP users. Name of the stack on which this command is executed. <stack-name> -If not passed, the first stack configured in ShellExecutor will be used. <networkId> - A digital parameter that means to which virtual SS7 network belongs a Rule. If this parameter is skipped - networkId will be set to "0" when a Rule creation. Refer <xref linkend="design_multitenancy"/>.

7.4.19. Delete a Rule

7.4.19.1. Using CLI

You can delete a Rule by issuing the command sccp rule delete with appropriate parameters as described below:

```
Name
    sccp rule delete
SYNOPSIS
    sccp rule delete <id> stackname <stack-name>
DESCRIPTION
    This command is used to remove a previously defined Rule.
PARAMETERS
    Standard Parameters
    <id>
                  -
                     The identifier of the Rule that is being deleted.
    Optional Parameters
    <stack-name> - Name of the stack on which this command is executed.
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
    sccp rule delete 1
    The above command will delete the Rule identified by the number '1'.
```

7.4.19.2. Using GUI

Procedure: Delete a Rule using GUI

- 1. Navigate to the 'Rules' tab in the SCCP Management Unit window and locate the row corresponding to the Rule you wish to delete.
- 2. In the row corresponding to the identified Rule, click on the red 'x' button in the actions column to delete that Rule.

7.4.20. View all configured Remote Signaling Points (RSP)

7.4.20.1. Using CLI

You can view the details of all configured Remote Signaling Points by issuing the command sccp rsp show as described below:

Name sccp rsp show
SYNOPSIS sccp rsp show id <id> stackname <stack-name></stack-name></id>
DESCRIPTION This command is used to view the details of all configured Remote Signaling Points.
If an <id> is specified in the command, it will only display the details of the Remote Signaling Point identified by the value of the 'id' specified.</id>
PARAMETERS
Optional Parameters
<id> - The id of the Remote Signaling Point whose details are to be displayed. If this parameter is not specified, the details of all configured Remote Signaling Points will be displayed.</id>
<pre><stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.</stack-name></pre>

7.4.20.2. Using GUI

Navigate to the specific SCCP Management unit and switch to the 'RSP' tab. Here you can view a list of all the configured Remote Signaling Pointcodes. Every correctly configured RSP will be displayed in a row along with the defined values.

7.4.21. Create a new Remote Signaling Pointcode

7.4.21.1. Using CLI

You can create a new RSP by issuing the command sccp rsp create with appropriate parameters as described below:

Name sccp rsp create
SYNOPSIS sccp rsp create <id> <remote-spc> <rspc-flag> <mask> stackname <stack-name></stack-name></mask></rspc-flag></remote-spc></id>
DESCRIPTION This command is used to define a new Remote Signaling Point. Each remote signaling point that SCCP can communicate with must be configured using this command.
PARAMETERS
Standard Parameters
<id> - A unique number to identify this Remote Signaling Point.</id>
<remote-spc> - The Remote Signaling Point</remote-spc>
<rspc-flag> - 32 bit value. Not used for now. Reserved for future</rspc-flag>
<mask> - 32 bit value. Not used for now. Reserved for future</mask>
Optional Parameters
<pre><stack-name> - Name of the stack on which this command is executed.</stack-name></pre>
EXAMPLES sccp rsp create 1 6477 0 0

7.4.21.2. Using GUI

Procedure: Create a new RSP using GUI

- 1. Navigate to the 'RSP' tab in the SCCP Management window and click on the 'Create RSP' button. This will launch a new pop-up 'Create Remote Signaling Pointcode'.
- 2. In the 'Create Remote Signaling Pointcode' pop-up, add details of the new RSP being defined. You must ensure that you fill in all the mandatory parameters. For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new RSP will be created with parameters as specified. If there is an error in creating the RSP then you will find the details of the error in the Management Console Log section below.

4. Click on the 'Close' button to close the 'Create Remote Signaling Pointcode' pop-up.

7.4.22. Modify a Remote Signaling Pointcode

7.4.22.1. Using CLI

You can modify the values of a RSP by issuing the command sccp rsp modify with appropriate parameters as described below:

```
Name
   sccp rsp modify
SYNOPSTS
   sccp rsp modify <id> <remote-spc> <rspc-flag> <mask> stackname <stack-name>
DESCRIPTION
   This command is used to modify the values of a Remote Signaling Point previously
   defined.
PARAMETERS
   Standard Parameters
   <id>
                 - Identifier of the Remote Signaling Point to be
                   modified.
   <remote-spc> - The Remote Signaling Point
   <rspc-flag>
                         32 bit value. Not used for now.
                    -
                   Reserved for future
   <mask>
                         32 bit value. Not used for now.
                   Reserved for future
   Optional Parameters
   <stack-name> - Name of the stack on which this command is executed.
                   If not passed, the first stack configured in ShellExecutor
                   will be used.
```

7.4.23. Delete a Remote Signaling Pointcode

7.4.23.1. Using CLI

You can delete a RSP by issuing the command sccp rsp delete with appropriate parameters as described below:

```
Name
    sccp rsp delete
SYNOPSIS
   sccp rsp delete <id> stackname <stack-name>
DESCRIPTION
    This command is used to delete a Remote Signaling Point.
PARAMETERS
    Standard Parameters
    <id>
                  The identifier of the Remote Signaling Point that is being
                deleted.
    Optional Parameters
    <stack-name> - Name of the stack on which this command is executed.
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   sccp rsp delete 1
   The above command will delete the Remote Signaling Point identified by the
    number '1'.
```

7.4.23.2. Using GUI

Procedure: Delete a RSP using GUI

- 1. Navigate to the 'RSP' tab in the SCCP Management Unit window and locate the row corresponding to the RSP you wish to delete.
- 2. In the row corresponding to the identified RSP, click on the red 'x' button in the actions column to delete that RSP.

7.4.24. View all configured Remote Sub-Systems (RSS)

7.4.24.1. Using CLI

You can view the details of all configured Remote Sub-Systems by issuing the command sccp rss show as described below:

Name sccp rss show
SYNOPSIS sccp rss show id <id> stackname <stack-name></stack-name></id>
DESCRIPTION This command is used to view the details of all configured Remote Sub-Systems. If an <id> is specified in the command, it will only display the details of the Remote Sub-System identified by the value of the 'id' specified.</id>
PARAMETERS
Optional Parameters
<id> - The id of the Remote Sub-System whose details are to be displayed. If this parameter is not specified, the details of all configured Remote Sub-Systems will be displayed.</id>
<pre><stack-name> - Name of the stack on which this command is executed.</stack-name></pre>

7.4.24.2. Using GUI

Navigate to the specific SCCP Management unit and switch to the 'RSS' tab. Here you can view a list of all the configured Remote Sub-Systems. Every correctly configured RSS will be displayed in a row along with the defined values.

7.4.25. Create a new Remote Sub-System

7.4.25.1. Using CLI

You can create a new RSS by issuing the command sccp rss create with appropriate parameters as described below:

Name sccp rss create
SYNOPSIS sccp rss create <id> <remote-spc> <remote-ssn> <rss-flag> <mark-prohibited-when-spc-resuming> stackname <stack-name></stack-name></mark-prohibited-when-spc-resuming></rss-flag></remote-ssn></remote-spc></id>
DESCRIPTION This command is used to define a new Remote Sub-System. Each Remote Sub-System that SCCP can communicate with must be configured using this command. You must ensure that the Remote Signaling Point is configured prior to issuing this command.
PARAMETERS
Standard Parameters
<id> - A unique number to identify this Remote Sub-System.</id>
<remote-spc> - The Remote Signaling Point where this Remote Sub-System is being deployed.</remote-spc>
<remote-ssn> - The Remote Sub-System number.</remote-ssn>
<rss-flag> - 32 bit value. Not used for now. Reserved for future.</rss-flag>
Optional Parameters
<pre><mark-prohibited-when-spc-resuming></mark-prohibited-when-spc-resuming></pre>
<pre><stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.</stack-name></pre>
EXAMPLES sccp rss create 1 6477 8 0 prohibitedWhenSpcResuming

7.4.25.2. Using GUI

Procedure: Create a new RSS using GUI

1. Navigate to the 'RSS' tab in the SCCP Management window and click on the 'Create RSS' button. This will launch a new pop-up 'Create Remote Sub-System'.

- 2. In the 'Create Remote Sub-System' pop-up, add details of the new RSS being defined. You must ensure that you fill in all the mandatory parameters. For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new RSS will be created with parameters as specified. If there is an error in creating the RSS then you will find the details of the error in the Management Console Log section below.
- 4. Click on the 'Close' button to close the 'Create Remote Sub-System' pop-up.

7.4.26. Modify a Remote Signaling Sub-System

7.4.26.1. Using CLI

You can modify the values of a RSS by issuing the command sccp rss modify with appropriate parameters as described below:
Name

sccp rss modify

SYNOPSIS

sccp rss modify <id> <remote-spc> <remote-ssn> <rss-flag>
<mark-prohibited-when-spc-resuming> stackname <stack-name>

DESCRIPTION

This command is used to modify the values of a Remote Sub-System previously defined.

PARAMETERS

Standard Parameters

<id> -</id>	Identifier of the Remote Sub-System to be modified.		
<remote-spc></remote-spc>	- The Remote Signaling Point where this Remote Sub-System is deployed.		
<remote-ssn></remote-ssn>	- The Remote Sub-System number.		
<rss-flag></rss-flag>	- 32 bit value. Not used for now. Reserved for future.		
Optional Parameters			
<mark-prohibited< td=""><td>d-when-spc-resuming> Possible value: prohibitedWhenSpcResuming. When this parameter is specified, the configured subsystem is marked as prohibited when its corresponding signaling point code has been resumed.</td></mark-prohibited<>	d-when-spc-resuming> Possible value: prohibitedWhenSpcResuming. When this parameter is specified, the configured subsystem is marked as prohibited when its corresponding signaling point code has been resumed.		
Optional Parameters			
<mark-prohibited< td=""><td>d-when-spc-resuming> Possible value: prohibitedWhenSpcResuming. When this parameter is specified, the configured subsystem is marked as prohibited when its corresponding signaling point code has been resumed.</td></mark-prohibited<>	d-when-spc-resuming> Possible value: prohibitedWhenSpcResuming. When this parameter is specified, the configured subsystem is marked as prohibited when its corresponding signaling point code has been resumed.		
<stack-name> -</stack-name>	Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.		

7.4.27. Delete a Remote Signaling Sub-System

7.4.27.1. Using CLI

You can delete a RSS by issuing the command sccp rss delete with appropriate parameters as described below:

Name sccp rss delete SYNOPSIS sccp rss delete <id> stackname <stack-name> DESCRIPTION This command is used to delete a Remote Sub-System. PARAMETERS Standard Parameters <id> The identifier of the Remote Sub-System that is being deleted. **Optional Parameters** Name of the stack on which this command is executed. <stack-name> -If not passed, the first stack configured in ShellExecutor will be used. EXAMPLES sccp rss delete 1 The above command will delete the Remote Sub-System identified by the number '1'.

7.4.27.2. Using GUI

Procedure: Delete a RSS using GUI

- 1. Navigate to the 'RSS' tab in the SCCP Management Unit window and locate the row corresponding to the RSS you wish to delete.
- 2. In the row corresponding to the identified RSS, click on the red 'x' button in the actions column to delete that RSS.

7.4.28. View all configured Long Message Rules (LMR)

7.4.28.1. Using CLI

You can view the details of all configured Long Message Rules by issuing the command sccp lmr show as described below:

Name sccp lmr show		
SYNOPSIS sccp lmr show id <id> stackname <stack-name></stack-name></id>		
DESCRIPTION This command is used to view the details of all configured Long Message Rules. If an <id> is specified in the command, it will only display the details of the Long Message Rule identified by the value of the 'id' specified.</id>		
PARAMETERS		
Optional Parameters		
<id> - The id of the Long Message Rule whose details are to be displayed. If this parameter is not specified, the details of all configured Long Message Rules will be displayed.</id>		
<pre><stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.</stack-name></pre>		

7.4.28.2. Using GUI

Navigate to the specific SCCP Management unit and switch to the 'LMR' tab. Here you can view a list of all the configured Long Message Rules. Every correctly configured LMR will be displayed in a row along with the defined values.

7.4.29. Create a new Long Message Rule

7.4.29.1. Using CLI

You can create a new LMR by issuing the command sccp lmr create with appropriate parameters as described below:

Name sccp lmr create		
SYNOPSIS sccp lmr create <id> <first-spc> <last-spc> <long-message-rule-type> stackname <stack-name></stack-name></long-message-rule-type></last-spc></first-spc></id>		
DESCRIPTION This command is used to define a new Long Message Rule. Long message rules specify which message types (UDT/XUDT/LUDT) will be used for outgoing message encoding depends on dpc. If long message rules are not configured only UDT messages will be used.		
PARAMETERS		
Standard Parameters		
<id> - A unique number to identify this Long Message Rule.</id>		
<pre><first-spc> - The first value of the remote signaling point code range, for which this Long message Rule will apply.</first-spc></pre>		
<pre><last-spc> - The last value of the remote signaling point code range. If Long message rule specifies a single signaling point code, this value must be equal to first-spc.</last-spc></pre>		
<long-message-rule-type>- Message types used for the remote signaling point codes range. Possible values : udt, xudt, ludt and ludt_segm.</long-message-rule-type>		
Optional Parameters		
<pre><stack-name> - Name of the stack on which this command is executed.</stack-name></pre>		
EXAMPLES sccp lmr create 1 201 201 xudt		
sccp lmr create 2 230 239 udt		

7.4.29.2. Using GUI

Procedure: Create a new LMR using GUI

1. Navigate to the 'LMR' tab in the SCCP Management window and click on the 'Create LMR' button. This will launch a new pop-up 'Create Long Message Rule'.

- 2. In the 'Create Long Message Rule' pop-up, add details of the new LMR being defined. You must ensure that you fill in all the mandatory parameters. For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new LMR will be created with parameters as specified. If there is an error in creating the LMR then you will find the details of the error in the Management Console Log section below.
- 4. Click on the 'Close' button to close the 'Create Long Message Rule' pop-up.

7.4.30. Modify a Long Message Rule

7.4.30.1. Using CLI

You can modify the values of a LMR by issuing the command sccp lmr modify with appropriate parameters as described below:

Name sccp lmr modify SYNOPSIS sccp lmr modify <id> <first-spc> <last-spc> <long-message-rule-type> stackname <stack-name> DESCRIPTION This command is used to modify the values of a Long Message Rule previously defined. PARAMETERS Standard Parameters <id> - Identifier of the Long Message Rule to be modified. <first-spc> The first value of the remote signaling point code range, for which this Long message Rule will apply. <last-spc> - The last value of the remote signaling point code range. If Long message rule specifies a single signaling point code, this value must be equal to first-spc. <long-message-rule-type>- Message types used for the remote signaling point codes range. Possible values : udt, xudt, ludt and ludt_segm. **Optional Parameters** <stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.

7.4.31. Delete a Long Message Rule

7.4.31.1. Using CLI

You can delete a LMR by issuing the command sccp lmr delete with appropriate parameters as described below:

```
Name
    sccp lmr delete
SYNOPSIS
    sccp lmr delete <id> stackname <stack-name>
DESCRIPTION
    This command is used to delete a Long Message Rule.
PARAMETERS
    Standard Parameters
    <id>
                  The identifier of the Long Message Rule that is being
                deleted.
    Optional Parameters
    <stack-name> - Name of the stack on which this command is executed.
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
    sccp lmr delete 1
    The above command will delete the Long Message Rule identified by the number '1'.
```

7.4.31.2. Using GUI

Procedure: Delete a Long Message Rule using GUI

- 1. Navigate to the 'LMR' tab in the SCCP Management Unit window and locate the row corresponding to the LMR you wish to delete.
- 2. In the row corresponding to the identified LMR, click on the red 'x' button in the actions column to delete that LMR.

7.4.32. View all configured Concerned Signaling Point Codes (CSP)

7.4.32.1. Using CLI

You can view the details of all configured Concerned Signaling Point Codes by issuing the command sccp csp show as described below:

Name		
sccp csp show		
SYNOPSIS sccp csp show id <id> stackname <stack-name></stack-name></id>		
DESCRIPTION This command is used to view the details of all configured Concerned Signaling Point Codes. If an <id> is specified in the command, it will only display the details of the Concerned Signaling Point Code identified by the value of the 'id' specified.</id>		
PARAMETERS		
Optional Parameters		
<id> - The id of the Concerned Signaling Point Code whose details are to be displayed. If this parameter is not specified, the details of all configured Concerned Signaling Point Codes will be displayed.</id>		
<pre><stack-name> - Name of the stack on which this command is executed.</stack-name></pre>		

7.4.32.2. Using GUI

Navigate to the specific SCCP Management unit and switch to the 'CSP' tab. Here you can view a list of all the configured Concerned Signaling Point Code. Every correctly configured CSP will be displayed in a row along with the defined values.

7.4.33. Create a new Concerned Signaling Point Code

7.4.33.1. Using CLI

You can create a new CSP by issuing the command sccp csp create with appropriate parameters as described below:

Name sccp csp create
SYNOPSIS sccp csp create <id> <spc> stackname <stack-name></stack-name></spc></id>
DESCRIPTION This command is used to define a new Concerned Signaling Point Code. Concerned signaling point codes define a DPC list that will be notified when local SSN is registered (SSA messages) or unregistered (SSP messages).
PARAMETERS
Standard Parameters
<id> - A unique number to identify this Concerned Signaling Point Code.</id>
<pre><spc> - The Remote Signaling Point Code, which will be notified.</spc></pre>
Optional Parameters
<pre><stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.</stack-name></pre>
EXAMPLES
sccp csp create 1 201
sccp csp create 2 202

7.4.33.2. Using GUI

Procedure: Create a new CSP using GUI

- 1. Navigate to the 'CSP' tab in the SCCP Management window and click on the 'Create CSP' button. This will launch a new pop-up 'Create Concerned Signaling Point Code'.
- 2. In the 'Create Concerned Signaling Point Code' pop-up, add details of the new CSP being defined. You must ensure that you fill in all the mandatory parameters. For definition of these parameters, please refer to the description of the CLI command for the same in the preceding section.
- 3. Verify the details entered and then click on the 'Create' button. A new CSP will be created with parameters as specified. If there is an error in creating the CSP then you will find the details of the error in the Management Console Log section below.
- 4. Click on the 'Close' button to close the 'Create Concerned Signaling Point Code' pop-up.

7.4.34. Modify a Concerned Signaling Point Code

7.4.34.1. Using CLI

You can modify the values of a CSP by issuing the command sccp csp modify with appropriate parameters as described below:

Name sccp csp modify SYNOPSIS sccp csp modify <id> <spc> stackname <stack-name> DESCRIPTION This command is used to modify the values of a Concerned Signaling Point Code previously defined. PARAMETERS Standard Parameters <id> Identifier of the Concerned Signaling Point Code to be modified. The Remote Signaling Point Code, which will be <spc> notified. **Optional Parameters** Name of the stack on which this command is executed. <stack-name> -If not passed, the first stack configured in ShellExecutor will be used.

7.4.35. Delete a Concerned Signaling Point Code

7.4.35.1. Using CLI

You can delete a CSP by issuing the command sccp csp delete with appropriate parameters as described below:

```
Name
    sccp csp delete
SYNOPSIS
    sccp csp delete <id> stackname <stack-name>
DESCRIPTION
    This command is used to delete a Concerned Signaling Point Code.
PARAMETERS
    Standard Parameters
    <id>
                  The identifier of the Concerned Signaling Point Code
                that is being deleted.
    Optional Parameters
    <stack-name> - Name of the stack on which this command is executed.
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
    sccp csp delete 1
    The above command will delete the Concerned Signaling Point Code identified by the
    number '1'.
```

7.4.35.2. Using GUI

Procedure: Delete a Concerned Signaling Point Code using GUI

- 1. Navigate to the 'CSP' tab in the SCCP Management Unit window and locate the row corresponding to the CSP you wish to delete.
- 2. In the row corresponding to the identified CSP, click on the red 'x' button in the actions column to delete that CSP.

7.5. TCAP Management

Transaction Capabilities Application Part , from ITU-T recommendations Q.771-Q.775 or ANSI T1.114 is a protocol for Signalling System 7 networks. Its primary purpose is to facilitate multiple concurrent dialogs between the same sub-systems on the same machines, using Transaction IDs to differentiate these, similar to the way TCP ports facilitate multiplexing connections between the same IP addresses on the Internet.

7.5.1. Using CLI

You can manage all TCAP stack properties through the Command Line Interface by using the tcap command.

7.5.2. Using GUI

The GUI will allow you to manage your TCAP configurations efficiently using a user-friendly interface. Open a Web Browser and navigate to http://localhost:8080/jss7-management-console/. Click on the 'TCAP' link in the left panel. The main panel will display the names of all configured TCAP Management units. To configure or view the settings of a particular TCAP Management Unit you must click on the name of that unit. The GUI will look similar to the figure below.

🔇 🕽 😋 🗋 localhost:8080/jss7-management-console/#			Q	☆ 😮 🜄

12:44:47:322 [INFO] Telscale jSS7 Management Console ready	y!			

Figure 26. GUI - TCAP Management

The first tab will display the properties of the TCAP Management unit. These details displayed here are fetched from the XML descriptor file *jboss-beans.xml*, which is located at *\$JBOSS_HOME/server/profile_name/deploy/mobicents-ss7-service/META-INF*, where profile_name is the server profile name. These properties can be modified here in the GUI. To modify them you must click the pencil, change value and save. The GUI will then display the modified values.

7.5.3. TCAP stack properties

7.5.3.1. Dialog Idle Timeout

7.5.3.1.1. Using CLI

You can set the 'dialogidletimeout' by issuing the command tcap set dialogidletimeout with appropriate parameters as described below. You can verify this by issuing the command tcap get dialogidletimeout which will display the value set for this property.

```
Name
   tcap set dialogidletimeout
SYNOPSIS
   tcap set dialogidletimeout <dialogidletimeout> stackname <stack-name>
DESCRIPTION
   Sets millisecond value for dialog timeout. It specifies how long
   dialog can be idle - not receive/send any messages.
   When a timeout occurs the method `TCListener.onDialogTimeout()` will be
   invoked. If a TCAP-User does not invoke 'Dialog.keepAlive()' inside
   the method 'TCListener.onDialogTimeout()', the TCAP Dialog will be
   released.
PARAMETERS
   Standard Parameters
   <dialogidletimeout> - Timeout in milliseconds.
   Optional Parameters
   <stack-name> -
                      Name of the stack on which this command is executed.
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   tcap set dialogidletimeout 30000
```

7.5.3.1.2. Using GUI

On TCAP management page, click on pencil against the 'Dialog Idle Timeout' property and text box becomes editable. Change value and save.

7.5.3.2. Dialog Id Range End

TCAP stack can be configured to use a range of local DialogId values. You may install a set of TCAP Stack instances with different DialogId ranges. These ranges can be used for loadsharing of SS7 traffic between the TCAP instances. All the outgoing Dialogs will have id starting with dialogIdRangeStart. This value of dialogIdRangeStart cannt be greater than dialogIdRangeEnd. In addition, the value of dialogIdRangeEnd - dialogIdRangeStart must always be less than the value of maxDialogs.

7.5.3.2.1. Using CLI

You can set the 'dialogidrangeend' by issuing the command tcap set dialogidrangeend with appropriate parameters as described below. You can verify this by issuing the command tcap get dialogidrangeend which will display the value set for this property.

Name tcap set dialogidrangeend		
SYNOPSIS tcap set dialogidrangeend <dialogidrangeend> stackname <stack-name></stack-name></dialogidrangeend>		
DESCRIPTION End of the range of the generated dialog ids. The id's used will be between dialogidrangestart and dialogidrangeend.		
PARAMETERS		
Standard Parameters		
<dialogidrangeend> - Dialog id range end.</dialogidrangeend>		
Optional Parameters		
<pre><stack-name> - Name of the stack on which this command is executed.</stack-name></pre>		
EXAMPLES tcap set dialogidrangeend 30000000		

7.5.3.2.2. Using GUI

On TCAP management page, click on pencil against the 'Dialog Id Range End' property and text box becomes editable. Change value and save.

7.5.3.3. Dialog Id Range Start

7.5.3.3.1. Using CLI

You can set the 'dialogidrangestart' by issuing the command tcap set dialogidrangestart with appropriate parameters as described below. You can verify this by issuing the command tcap get dialogidrangestart which will display the value set for this property.

Name tcap set dialogidrangestart SYNOPSIS tcap set dialogidrangestart <dialogidrangestart> stackname <stack-name> DESCRIPTION Start of the range of the generated dialog ids. The id's used will be between dialogidrangestart and dialogidrangeend. PARAMETERS Standard Parameters <dialogidrangestart> - Dialog id range start. **Optional Parameters** <stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used. **EXAMPLES** tcap set dialogidrangestart 1

7.5.3.3.2. Using GUI

On TCAP management page, click on pencil against the 'Dialog Id Range Start' property and text box becomes editable. Change value and save.

7.5.3.4. Do Not Send Protocol Version

7.5.3.4.1. Using CLI

You can set the 'donotsendprotocolversion' by issuing the command tcap set donotsendprotocolversion with appropriate parameters as described below. You can verify this by issuing the command tcap get donotsendprotocolversion which will display the value set for this property.

Name tcap set donotsendprotocolversion
SYNOPSIS tcap set donotsendprotocolversion <true false="" =""> stackname <stack-name></stack-name></true>
DESCRIPTION If set to true Protocol Version is not send in User Data part of Dialog
PARAMETERS
Standard Parameters
<pre><donotsendprotocolversion> - If true doesn't send the protocol version</donotsendprotocolversion></pre>
Optional Parameters
<pre><stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used.</stack-name></pre>
EXAMPLES tcap set donotsendprotocolversion false

7.5.3.4.2. Using GUI

On TCAP management page, click on pencil against the 'Do Not Send Protocol Version' property and text box becomes editable. Change value and save.

7.5.3.5. Invoke Timeout

7.5.3.5.1. Using CLI

You can set the 'invoketimeout' by issuing the command tcap set invoketimeout with appropriate parameters as described below. You can verify this by issuing the command tcap get invoketimeout which will display the value set for this property.

Name tcap set invoketimeout SYNOPSTS tcap set invoketimeout <invoketimeout> stackname <stack-name> DESCRIPTION Sets the Invoke timeout for this invoke. This property specifies, by default, how long Invoke will wait for a response from a peer before a timeout occurs. If a TCAP-User does not specify a custom Invoke timeout when sending a new Invoke, this default value will be used for outgoing Invoke timeout. When this timeout occurs 'TCListener.onInvokeTimeout()' will be invoked. invoketimeout should always be less than dialogidletimeout. This parameter affects if we use TCAP stack as the upperst level or we have implemented our own stack that reuses TCAP stack. Restcomm MAP and CAP stacks overrides this parameter at their levels and this parameter deos not affect these stacks. PARAMETERS Standard Parameters <invoketimeout> - Sets the Invoke timeout in milliseconds **Optional Parameters** Name of the stack on which this command is executed. <stack-name> -If not passed, the first stack configured in ShellExecutor will be used. EXAMPLES tcap set invoketimeout 30000

7.5.3.5.2. Using GUI

On TCAP management page, click on pencil against the 'Invoke Timeout' property and text box becomes editable. Change value and save.

7.5.3.6. Max Dialogs

7.5.3.6.1. Using CLI

You can set the 'maxdialogs' by issuing the command tcap set maxdialogs with appropriate parameters as described below. You can verify this by issuing the command tcap get maxdialogs which will display the value set for this property.

```
Name
   tcap set maxdialogs
SYNOPSIS
   tcap set maxdialogs <maxdialogs> stackname <stack-name>
DESCRIPTION
   Sets the maximum number of dialogs allowed to be alive at a given
   time. If not set, a default value of 5000 dialogs will be used.
   If stack ranges provided, maximum number dialogs naturally cannot
   be greater than the provided range, thus, it will be normalized to
   range delta (end - start).
PARAMETERS
   Standard Parameters
                     Sets the maximum concurrent dialogs alive at any given
   <maxdialogs> -
                        point in time.
   Optional Parameters
   <stack-name> -
                      Name of the stack on which this command is executed.
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   tcap set maxdialogs 3000000
```

7.5.3.6.2. Using GUI

On TCAP management page, click on pencil against the 'Max Dialogs' property and text box becomes editable. Change value and save.

7.5.3.7. Preview Mode

You can modify the settings for the parameter 'previewmode' only when the TCAP Stack is not running. In addition, this parameter cannot be modified through the CLI or GUI. You will have to invoke the setter function directly from the source code.

If you are using the JBoss Application Server, then you can set this parameter by adding a property (as shown below) to the XML descriptor file *jboss-beans.xml*, which is located at *\$JBOSS_HOME/server/profile_name/deploy/mobicents-ss7-service/META-INF*, where profile_name is the server profile name.

```
/*Add property for the parameter 'previewmode' to jboss-beans.xml file and specify
true or false*/
<property name="previewMode">true</property>
```

The current settings of the parameter can be viewed in the GUI or by invoking the appropriate CLI command as described below.

7.5.3.7.1. Using CLI

You can retrieve the current settings of the parameter 'previewmode' by issuing the command sctp get previewmode. However as explained above, you cannot modify the settings through the CLI.

```
Name
    tcap get previewmode
SYNOPSIS
    tcap get previewmode
DESCRIPTION
    This command is used to retrieve the current settings of the parameter
    'previewMode'. The 'previewMode' parameter is used for special processing
   mode.
   When Preview Mode is set to true:
    - In TCAP level the stack only listens for incoming messages and
    sends nothing.
    - Methods like send(), close(), sendComponent() and other such methods
    do nothing.
    - A TCAP Dialog is temporary. The TCAP Dialog is discarded after
    any incoming message like TC-BEGIN or TC-CONTINUE has been processed.
    - For any incoming messages (including TC-CONTINUE, TC-END, TC-ABORT) a new
   TCAP Dialog is created (and then deleted).
    - There are no timers and timeouts.
    The settings of this parameter can be modified only when the TCAP Stack is
    not running. To modify this parameter you must invoke the setter function
    directly from the code or if you are using the JBoss AS, you can add a
    property to the XML descriptor file jboss-beans.xml. You cannot change the
    settings through the CLI.
```

7.5.3.7.2. Using GUI

In the TCAP management page, you can view the current settings of the 'Preview Mode' property. But as explained above, you cannot change the settings in the GUI. For more details about this parameter, refer to the detailed description about the parameter in the above section for CLI.

7.5.3.8. Statistics Enabled

7.5.3.8.1. Using CLI

You can set the 'statisticsenabled' by issuing the command tcap set statisticsenabled with appropriate parameters as described below. You can verify this by issuing the command tcap get statisticsenabled which will display the value set for this property.

Name tcap set statisticsenabled SYNOPSIS tcap set statisticsenabled <true | false> stackname <stack-name> DESCRIPTION If set to true, statistics is enabled. Its recommended to keep this off for better performance and enabled statistics only when needed. PARAMETERS Standard Parameters <statisticsenabled> - If true, statistics is enabled **Optional Parameters** <stack-name> - Name of the stack on which this command is executed. If not passed, the first stack configured in ShellExecutor will be used. **EXAMPLES** tcap set statisticsenabled false

7.5.3.8.2. Using GUI

On TCAP management page, click on pencil against the 'Statistics Enabled' property and text box becomes editable. Change value and save.

7.5.3.9. SLS Range

7.5.3.9.1. Using CLI

You can set the 'slsrange' by issuing the command tcap set slsrange with appropriate parameters as described below. You can verify this by issuing the command tcap get slsrange which will display the value set for this property.

```
Name
   tcap set slsrange
SYNOPSIS
   tcap set slsrange <All | Odd | Even> stackname <stack-name>
DESCRIPTION
    slsRanger: set the value of SLS to odd or even or both.
PARAMETERS
    Standard Parameters
             If set to All, SLS number can be odd or even value
    <All> -
    <0dd> -
             If set to Odd, SLS number can get only odd value
    <Even>
                  If set to Even, SLS number can get only even value
             -
    Optional Parameters
                      Name of the stack on which this command is executed.
    <stack-name> -
                    If not passed, the first stack configured in ShellExecutor
                    will be used.
EXAMPLES
   tcap set slsrange All
```

7.5.3.9.2. Using GUI

On TCAP management page, click on pencil against the 'SLS Range' property and text box becomes editable. Change value and save.

7.6. Statistics

The GUI will allow you to create campaigns of fixed duration for gathering statistics data. Campaign allows to select time period over which these statistics have been gathered (in hours, minutes and seconds). Once Campaign is defined, the statistics can be observed by clicking newly created campaign name or you can also navigate to Metrics (click Metrics on left panel) to get graph of statistics.

7.6.1. Create Campaign

To create new campaign open a Web Browser and navigate to http://localhost:8080/jss7management-console/. Click on the 'Manage Campaigns' link in the left panel. The main panel will display the names of all existing campaigns and also button to create new campaign. The GUI will look similar to the figure below.

C localhost:8080/jss7-management-console/#		ବ ଜ୍ଞ ବ 🔳

Metrics		
🖹 Management Console Log		<u>`</u>
10:31:56:451 [INFO] Campaign Short5SecCam	paign deatils retrieved.	Ĵ.

Figure 27. GUI - Campaigns

Click on 'Create Statistics Campaign' button to create new campaign. Select the stack from 'Counter Definition Set Name' drop down on which you want to define new campaign. Next select the time period from 'Duration' drop down and enter unique 'Campaign Name'. An 'Output format' field allows you to select a type of statistics logging: CSV, verbose or both of them.

The stack on which new campaign is defined must have set 'Statistics Enabled' property to true

7.6.2. View Campaigns

The GUI will allow you to view existing campaigns. On the main panel click campaign name. The GUI will look similar to the figure below and is divided into tabs.

The first tab will display the properties of the campaign. Second tab explains all the counters in this campaigns and their definition. Last tab provides the values for each of these counters. Last tab also displays the 'Start Time' and 'End Time' representing time duration for which sample was collected.

← → C ① localhost.8080/jss7-management-console/# telestax jSS7 MANAGEMENT	CONSOLE		् 😒 🔍 😒

Management Console Log
16:28:48:420 [INFO] Campaign Short5SecCampaign details retrieved

Figure 28. GUI - Campaigns View

Restcomm jSS7 doesn't persist the statistics, hence the data collected for campaign period refresh's every defined 'Duration'. User must refresh the page every 'Duration' period to gather statistics data for previous time period.

0

Nevertheless you can also click on 'Metrics' link on left panel, select the Campaign and observe the statistics graph. The metrics page gathers data from time page was loaded till user navigates away. Hence graph will show historic data from point page was loaded.

7.6.3. Logging Stats

The GUI will allow you to view stats in real time. But the stats are not stored in the Database for you to analyse at a later point of time. However Restcomm jSS7 gives you an option to have the stats logged every refresh period for all the existing campaigns. You can look at the log files at any point of time for analysing or understanding the performance.

If you wish to have stats logged, you must configure the settings in the file *jboss-5.1.0.GA/server/default/conf/jboss-log4j.xml*. If you are running the platform as standalone, then you should configure in *log4j.xml*.

Logging stats to main server log file

If you wish to have the stats logged in the main server log file located at *jboss-5.1.0.GA/server/default/log/server.log*, then you must add a new category to the *jboss-log4j.xml* as shown below and set priority value to "DEBUG". For verbose stats:

```
<category name="org.mobicents.protocols.ss7.oam.common.statistics.StatsPrinter"
additivity="false">
        <priority value="DEBUG" />
</category>
```

Logging stats to a separate stats log files

If you wish to have the stats logged to a separate log files located at *jboss*-*5.1.0.GA/server/default/log/stats.log* and *jboss-5.1.0.GA/server/default/log/csvstats.log*, then you must add a new appenders to the *jboss-log4j.xml* and change category as shown below. You must set the priority value to "DEBUG".

```
<appender name="STATS" class="org.jboss.logging.appender.DailyRollingFileAppender">
<errorHandler class="org.jboss.logging.util.OnlyOnceErrorHandler"/>
<param name="File" value="$</pre>
{jboss.server.home.dir}
/log/stats.log"/>
<param name="Append" value="true"/>
<param name="MaxFileSize" value="500KB" />
<param name="MaxBackupIndex" value="1" />
<param name="Threshold" value="DEBUG"/>
<param name="DatePattern" value="'.'yyyy-MM-dd"/>
<layout class="org.apache.log4j.PatternLayout">
<param name="ConversionPattern" value="%d %-5p [%c] %m%n"/>
</layout>
</appender>
<category name="org.mobicents.protocols.ss7.oam.common.statistics.StatsPrinter"
additivity="false">
<priority value="DEBUG" />
<appender-ref ref="STATS"/>
</category>
<appender name="CSVSTATS" class="org.jboss.logging.appender.DailyRollingFileAppender">
<errorHandler class="org.jboss.logging.util.OnlyOnceErrorHandler"/>
<param name="File" value="$</pre>
{jboss.server.home.dir}
/log/csvstats.log"/>
<param name="Append" value="true"/>
<param name="MaxFileSize" value="500KB" />
<param name="MaxBackupIndex" value="1" />
<param name="Threshold" value="DEBUG"/>
<param name="DatePattern" value="'.'yyyy-MM-dd"/>
<layout class="org.apache.log4j.PatternLayout">
<param name="ConversionPattern" value="%d %-5p [%c] %m%n"/>
</layout>
</appender>
<category name="org.mobicents.protocols.ss7.oam.common.statistics.CsvStatsPrinter"
additivity="false">
<priority value="DEBUG" />
<appender-ref ref="CSVSTATS"/>
</category>
```

As of today Restcomm jSS7 exposes statistics only for TCAP. Future releases will allow statistics for M3UA, SCCP, MAP and CAP also.

7.7. Alarms

The GUI will allow you to view the Alarms (Critical, Major, Minor, Warning) in the system and filter them based on the severity. Open a Web Browser and navigate to http://localhost:8080/jss7-management-console. Click on the 'Alarms' link in the left panel. The main panel will display all the currently raised alarms. You can filter the view by using the checkboxes at the top to select/deselect

the severity options and accordingly filter the display.

You will notice that as soon as the problem is resolved, the corresponding alarm will disappear from the view. In future releases, there will be an option to persist this alarms data and hence you will be able to view a history of alarms raised and resolved. But as of now, only currently active alarms will be displayed in this window.

Chapter 8. M3UA

8.1. Restcomm Signaling Gateway M3UA Stack

M3UA is a client-server protocol supporting the transport of any SS7 MTP3-User signaling (e.g. ISUP and SCCP messages) over IP. M3UA is defined by the IETF SIGTRAN working group in RFC 4666. Restcomm M3UA Stack can be used on the Application Server side or on the Signaling Gateway side or can also be used in peer-to-peer mode IPSP.

M3UA uses the Restcomm SCTP (Stream Control Transmission Protocol) Stack.

Note

Restcomm SCTP Stack uses Java SCTP layer which is only available from JDK 7 onwards.

8.1.1. M3UA Load Balancing

Load Balancing can be configured by using the M3UA configuration parameter useLsbForLinksetSelection defined in the *jboss-beans.xml* file. Refer to Configuring M3UA for more details on configuring this.

Depending on the configuration (useLsbForLinksetSelection set to true or false), either the least significant bit or the most significant bit of SLS is used for load balancing between two Application Servers. The remaining bits in the SLS are used for load balancing between ASPs within each AS.

8.1.2. Restcomm M3UA Stack on the Application Server side

The figure below demonstrates the basic functionality of the Restcomm M3UA Stack when configured as an Application Server (AS) that will communicate with an External Signaling Gateway.

192.168.0.101

To use M3UA Stack as an AS, the Routing Context (RC) may not be known and is optional. Refer to Configuring M3UA for help in configuring M3UA Stack as an AS.

8.1.3. Restcomm M3UA Stack on the Signaling Gateway side

The figure below demonstrates the basic functionality of the Restcomm M3UA Stack when configured as a Signaling Gateway (SG). The Restcomm Signaling Gateway provides the Nodal Interworking Function (NIF) that allows SS7 Signaling (SCCP/ISUP) to be inter-worked into the M3UA/IP Network.

Restcomm M3UA Stack used on the SG side will share a common point code with a set of M3UA Application Servers. You can configure the M3UA stack on SG side in one of the two traffic modes: Loadbalance or Override. Broadcast traffic mode is not supported. Refer to Configuring Restcomm Signaling Gateway for instructions on configuring M3UA Stack as SG. Restcomm M3UA Stack used on SG side doesn't support routing key management messages. The Routing Key should be provisioned statically using the management console.

8.1.4. Restcomm M3UA Stack as IPSP

An IPSP is essentially the same as an ASP, except that it uses M3UA in a point-to-point fashion. Conceptually, an IPSP does not use the services of a Signalling Gateway node.

8.2. Route

Before you can transfer Payload Data from M3UA-User to a peer, you must define the route based on Destination Point Code (DPC), Originating Point Code (OPC) and Service Indicator (SI). For details on how to add a new Route, please refer to Create a new M3UA Route.

While DPC is mandatory and should be an actual value, OPC and SI can be -1 indicating wild card. The table below shows an example of a routeset table. The routeset table contains routesets for all the possible destinations that can be reached. This table is searched to find a match for the DPC:OPC:SI to be routed. If a match is found in the list of Application Servers, an AS is chosen from the available routes associated with the routeset. If an AS is not found, SI is substitued with -1 (DPC:OPC:-1) and a match is searched for again. If a match still is not found, OPC is substituted with -1 (DPC:-1:-1) and the table is searched again for a match. If there is still no matching AS, MSU is dropped and routing does not take place.

Table 4. Routesets

DPC	OPC	SI	AS Name
2	3	2	AS1, AS2
2	3	-1	AS1, AS2
4	-1	-1	AS3

8.3. Load Sharing

M3UA load-balancing makes use of the SLS field of the Protocol Data carried in the Payload Data Message. M3UA can be configured as below:

- load-balance between Application Servers (AS) for a given route. For any given route, there can be a maximum of 16 ASs defined.
- load-balance within an AS and between Application Server Processes (ASP). A maximum 128 ASPs can be defined within an AS for load-sharing.

For even distribution of messages in the network it is recommended that you define an even number of ASs for a route for load sharing. You must ensure that you take proper care in deciding on a number of ASs for a route and number of ASPs within an AS depending on the routing label format of MSU.

M3UA can be configured to use either the highest or lowest bits of the SLS for AS selection. The number of SLS bits used for AS selection depends on the number of maximum AS defined for a route. The remaining bits are used for ASP selection.

Max AS for Route	Number of SLS bits used for AS	Max ASPs that can be used within an AS
1 or 2	1	128
3 or 4	2	64
5 to 8	3	32
9 to 16	4	16

Table 5. Routesets

8.4. M3UA Internal State Machine

Restcomm M3UA Stack maintains finite state machine (FSM) for each ASP and AS. Its important to understand these state's to troubleshoot the M3UA handshake messages exchanged

The FSM for ASP at AS side (or IPSPS client side) is referred to as LocalFSM and FSM for AS at AS side (or IPSP client side) is referred to as PeerFSM. Similarly FSM for ASP at SGW side (or IPSP server side) is referred to as PeerFSM and FSM for AS at SGW side (or IPSP server side) is referred to as LocalFsm.

Figure below shows the various state of ASP at AS and SGW side. In below example only Single Exchange of messages are considered for handshake mechanism

Figure 29. Restcomm M3UA Stack ASP state machine

Figure below shows the various state of AS at AS and SGW side. In below example only Single Exchange of messages are considered for handshake mechanism

Figure 30. Restcomm M3UA Stack AS state machine for AS - SGW

For IPSP, the ASP state machine remains same as AS-SGW, however for AS the state machine changes a bit as there is no exchange of Notify (NTFY) messages. Figure below shows the various state of AS at IPSP Client and Server side. In below example only Single Exchange of messages are considered for handshake mechanism

Figure 31. Restcomm M3UA Stack AS state machine for IPSP Client - Server

In Double Exhcnage handshake mechanism both Local and Peer FSM exist in ASP and AS at each side. Hence the number of handshake messages exchanged are twice that of Single Exchange.

Chapter 9. ISUP

(ISDN User Part or ISUP) is part of which is used to establish telephone calls and manage call switches(exchanges). Exchanges are connected via E1 or T1 trunks. Each trunk is divided by means of TDM into time slots. Each time slot is distinguished as circuit. Circuits (identified by code) are used as medium to transmit voice data between user equipment (or exchanges if more than one is involved).

allows not only to setup a call, but to exchange information about exchange state and its resources(circuits).

Restcomm is based on Q.76X series of documents.

9.1. ISUP Configuration

Restcomm stack is configured with simple properties. Currently following properties are supported:

Name	Default value	Value range	Description
ni	None, must be provided	0-3	Sets value of network indicator that should be used by stack.
localspc	None, must be provided	0 - (2^14)-1	Sets local signaling point code. It will be used as OPC for outgoing signaling units.
t1	4s	4s - 15s	Sets T1 value. Started when REL is sent. See A.1/Q.764
t5	5 min.	5min - 15 min	Sets T5 value. Started when initial REL is sent. See A.1/Q.764
t7	20s	20s -30s	Sets T7 value. (Re)Started when Address Message is sent. See A.1/Q.764
t2	15s	15s - 60s	Sets T12 value. Started when BLO is sent. See A.1/Q.764
t13	5min	5min - 15min	Sets T13 value. Started when initial BLO is sent. See A.1/Q.764

Table 6. ISUP Configuration options

Name	Default value	Value range	Description
t14	5s	15s - 60s	Sets T14 value. Started when UBL is sent. See A.1/Q.764
t15	5min	5min - 15min	Sets T15 value. Started when initial UBL is sent. See A.1/Q.764
t16	5s	15s - 60s	Sets T16 value. Started when RSC is sent. See A.1/Q.764
t17	5min	5min - 15min	Sets T17 value. Started when initial RSC is sent. See A.1/Q.764
t18	5s	15s - 60s	Sets T18 value. Started when CGB is sent. See A.1/Q.764
t19	5min	5min - 15min	Sets T19 value. Started when initial CGB is sent. See A.1/Q.764
t20	5s	15s - 60s	Sets T20 value. Started when CGU is sent. See A.1/Q.764
t21	5min	5min - 15min	Sets T21 value. Started when initial CGU is sent. See A.1/Q.764
t22	5s	15s - 60s	Sets T22 value. Started when GRS is sent. See A.1/Q.764
t23	5min	5min - 15min	Sets T23 value. Started when initial GRS is sent. See A.1/Q.764
t28	10s	10s	Sets T28 value. Started when CQM is sent. See A.1/Q.764
t33	12s	12s - 15s	Sets T33 value. Started when INR is sent. See A.1/Q.764

Note that before start user must provide two interfaces to stack:

Mtp3UserPart

implementation of transport layer which should be used by stack

CircuitManager

circuit manager implementation. This interface stores information on mapping between CIC(Circuit Identification Code) and DPC(Destination Point Code) used as destination for outgoing

9.2. ISUP Usage

The org.mobicents.protocols.ss7.isup.ISUPStack interface defines the methods required to represent ISUP Protocol Stack. ISUPStack exposes org.mobicents.protocols.ss7.isup.ISUPProvider. This interface defines the methods that will be used by any registered ISUP User application implementing the org.mobicents.protocols.ss7.isup.ISUPListener to listen ISUP events(messages and timeouts).

9.3. ISUP Example

Below is simple example of stack usage:

```
import java.io.ByteArrayOutputStream;
import java.io.IOException;
import java.util.ArrayList;
import java.util.List;
import java.util.Properties;
import org.mobicents.protocols.ss7.isup.ISUPEvent;
import org.mobicents.protocols.ss7.isup.ISUPListener;
import org.mobicents.protocols.ss7.isup.ISUPProvider;
import org.mobicents.protocols.ss7.isup.ISUPStack;
import org.mobicents.protocols.ss7.isup.ISUPTimeoutEvent;
import org.mobicents.protocols.ss7.isup.ParameterException;
import org.mobicents.protocols.ss7.isup.impl.ISUPStackImpl;
import org.mobicents.protocols.ss7.isup.message.ISUPMessage;
import org.mobicents.ss7.linkset.oam.Layer4;
import org.mobicents.ss7.linkset.oam.Linkset;
public class ISUPTest implements ISUPListener
{
    protected ISUPStack stack;
    protected ISUPProvider provider;
    protected Linkset isupLinkSet;
    public void setUp() throws Exception {
        this.isupLinkSet = ....; //same linksets as in SS7Service
        this.stack = new ISUPStackImpl();
        this.stack.configure(getSpecificConfig());
        this.provider = this.stack.getIsupProvider();
        this.provider.addListener(this);
        Mtp3UserPart userPart = // create with proper factory, dahdii, dialogi, m3ua
```

```
this.stack.setMtp3UserPart(userPart);
        CircuitManagerImpl circuitManager = new CircuitManagerImpl();
        circuitManager.addCircuit(1, 431613); // CIC - 1, DPC for it - 431613
        this.stack.setCircuitManager(circuitManager);
        this.stack.start();
    }
    public void onEvent(ISUPEvent event) {
        ISUPMessage msg = event.getMessage();
        switch(msg.getCircuitIdentificationCode().getCIC())
        {
            case AddressCompleteMessage._COMMAND_CODE:
            //only complete
            break:
            case ConnectedMessage._COMMAND_CODE:
            case AnswerMessage._COMMAND_CODE:
            //we are good to go
            ConnectedNumber cn = (ConnectedNumber)msg.getParameter(ConnectedNumber
._PARAMETER_CODE);
            //do something
            break;
            case ReleaseMessage._COMMAND_CODE:
            //remote end does not want to talk
            RealeaseCompleteMessage rlc = provider.getMessageFactory().createRLC();
            rlc.setCircuitIdentificationCode(msg.getCircuitIdentificationCode());
            rlc.setCauseIndicators( ((ReleaseComplete)msg).getCauseIndicators());
            provider.sendMessage(rlc);
        }
   }
    public void onTimeout(ISUPTimeoutEvent event) {
        switch(event.getTimerId())
        {
            case ISUPTimeoutEvent.T1:
                //do something
                break;
            case ISUPTimeoutEvent.T7:
                //do even more
                break;
        }
   }
}
```
Chapter 10. SCCP

The Signaling Connection Control Part (SCCP) is defined in ITU-T Recommendations Q.711-Q.716. SCCP sits on top of Message Transfer Part 3 (MTP3) in the SS7 protocol stack. The SCCP provides additional network layer functions to provide transfer of noncircuit-related (NCR) signaling information, application management procedures and alternative, more flexible methods of routing.

10.1. Routing Management

SCCP provides a routing function that allows signaling messages to be routed to a signaling point based on dialed digits, for example. This capability is known as Global Title Translation (GTT), which translates what is known as a global title (for example, dialed digits for a toll free number) into a signaling point code and a subsystem number so that it can be processed at the correct application.

10.1.1. GTT Configuration

GTT is performed in two stages. First is matching the rule and second is actual translation.

For matching the rule, the called party address global title digits are matched with <digits> configured while defining the Rule. Once the digits match actual translation is done. Also for rule matching GT Indicator, translation type, numbering plan and nature-of-address of a rule and of message called party address must be equal.

Matching rule

As explained previously, the <digits> can be divided into sections using the "/" separate character. Each section defines set of digits to be matched. Wild card * can be used to match any digits and ? can be used to match exatcly one digit. For example Rule is to match starting 4 digits (should be 1234) and doesn't care for rest; the <digits> in the command will be 1234/*. If the Rule is such that starting 3 digits should be 123, doesn't care for other three digits but last two digits should be 78; the <digits> in the command will be 123/???/78. If digit to digit matching is needed the the <digits> in the command will be exact digits to be matched without sections.

Translation

Resulting Called Party Address will contain:

- PC in the generated CalledPartyAddress is taken from primary/backup address. This PC will not be encoded into a message if the following option is set: sccp set removespc true.
- SSN will be taken from primary/backup address. If it is absent there will be taken from an original message address. If also absent SSN will not be included.
- GT type (0001, 0010, 0011, 0100) is taken from from AI (AddressIndicator) of primary/backup address. If AI of primary/backup address contains "no GT" (or bad value) but after address translating we need GT it will be taken from AI of an original message address.
- NAI, TT, NP (and Encoding schema) is taken from GT of primary/backup address. If no GT in primary/backup address but after address translating we need GT it will be taken from GT

of an original message address.

- Digits for CalledPartyAddress will be generated in following way. For translation each section in <mask> defined while creating the Rule, defines how replacement operation is performed. If <mask> defines K (KEEP), the originally dialed digits are kept and if <mask> defines R (REPLACE) the digits from primary address or back address are used. The primary/backup address should always define the point code and the translated address will always have this point code. If the primary/backup address defines the subsystem number the translated address will also have this subsystem number. The address-indicator of translated address is always from primary/backup address. See below examples
 - 1. Example 1 : Remove the Global Title and add PC and SSN

Figure 32. GTT - Example 1

2. Example 2 : Partial Match Match a eight digit number starting "800", followed by any four digits, then "9". If the translated digits is not null and if the primary/backup address has no Global Title, the Global Title from dialed address is kept with new translated digits.

Figure 33. GTT - Example 2

3. Example 3 : Partial Match Match "800800", followed by any digits Remove the first six digits. Keep any following digits in the Input. Add a PC(123) and SSN (8).

Figure 34. GTT - Example 3

 Example 4 : Partial Match Match any digits keep the digits in the and add a PC(123) and SSN (8). If the translated digits is not null and if the primary/backup address has no Global Title, the Global Title from dialed address is kept with new translated digits.

Figure 35. GTT - Example 4

10.2. SCCP Usage

The instance of org.mobicents.protocols.ss7.sccp.SccpStack acts as starting point. All the sccp messages sent by SCCP User Part are routed as per the rule configured in Router

The term SCCP User Part refers to the applications that use SCCP's services.

The SCCP User Part gets handle to SccpStack by doing a JNDI look-up.

SccpStack exposes org.mobicents.protocols.ss7.sccp.SccpProvider that interacts directly with SccpStack. This interface defines the methods that will be used by SCCP User Part to send org.mobicents.protocols.ss7.sccp.message.SccpMessage and register [class]`org.mobicents.protocols.ss7.sccp.SccpListener's to listen for incoming SCCP messages.

SCCP User Part registers SccpListener for specific local subsystem number. For every incoming SccpMessage, if the called subsystem matches with this local subsystem, the corresponding SccpListner is called.

SccpProvider also exposes org.mobicents.protocols.ss7.sccp.message.MessageFactory and org.mobicents.protocols.ss7.sccp.parameter.ParameterFactory to create new SccpMessage. For transfer data via connectionless service org.mobicents.protocols.ss7.sccp.message.SccpDataMessage is used. (This class use UDT, XUDT, LUDT SCCP message type for message transfer.)

10.3. SCCP User Part Example

Below is SCCP User Part example listening for incoming SCCP message and sending back new message

```
package org.mobicents.protocols.ss7.sccp.impl;
```

```
import java.io.IOException;
import org.mobicents.protocols.ss7.indicator.NatureOfAddress;
import org.mobicents.protocols.ss7.indicator.NumberingPlan;
import org.mobicents.protocols.ss7.indicator.RoutingIndicator;
import org.mobicents.protocols.ss7.sccp.RemoteSccpStatus;
import org.mobicents.protocols.ss7.sccp.SccpListener;
import org.mobicents.protocols.ss7.sccp.SccpProvider;
import org.mobicents.protocols.ss7.sccp.SignallingPointStatus;
import org.mobicents.protocols.ss7.sccp.message.SccpDataMessage;
import org.mobicents.protocols.ss7.sccp.message.SccpNoticeMessage;
import org.mobicents.protocols.ss7.sccp.parameter.GlobalTitle;
import org.mobicents.protocols.ss7.sccp.parameter.HopCounter;
import org.mobicents.protocols.ss7.sccp.parameter.SccpAddress;
public class Test implements SccpListener {
        private SccpProvider sccpProvider;
       private SccpAddress localAddress;
        private int localSsn = 8;
        private static SccpProvider getSccpProvider() {
                Mtp3UserPartImpl mtp3UserPart1 = null;
                // .....
                // .....
                SccpStackImpl sccpStack1 = new SccpStackImpl("testSccpStack");
                sccpStack1.setMtp3UserPart(1, mtp3UserPart1);
                sccpStack1.start();
                return sccpStack1.getSccpProvider();
        }
        public void start() throws Exception {
                this.sccpProvider = getSccpProvider();
                int translationType = 0;
                GlobalTitle gt = GlobalTitle.getInstance(translationType,
                                NumberingPlan.ISDN MOBILE, NatureOfAddress.NATIONAL,
"1234");
                localAddress = new SccpAddress(RoutingIndicator
.ROUTING BASED ON GLOBAL TITLE, -1, qt, 0);
                this.sccpProvider.registerSccpListener(this.localSsn, this);
        }
       public void stop() {
                this.sccpProvider.deregisterSccpListener(this.localSsn);
        }
        @Override
        public void onMessage(SccpDataMessage message) {
                localAddress = message.getCalledPartyAddress();
                SccpAddress remoteAddress = message.getCallingPartyAddress();
                // now decode content
```

```
byte[] data = message.getData();
                // processing a request
                byte[] answerData = new byte[10];
                // put custom executing code here and fill answerData
                HopCounter hc = this.sccpProvider.getParameterFactory
().createHopCounter(5);
                SccpDataMessage sccpAnswer = this.sccpProvider.getMessageFactory
().createDataMessageClass1(
                                remoteAddress, localAddress, answerData, message
.getSls(),
                                localSsn, false, hc, null);
                try {
                        this.sccpProvider.send(sccpAnswer);
                } catch (IOException e) {
                        // TODO Auto-generated catch block
                        e.printStackTrace();
                }
        }
        @Override
        public void onNotice(SccpNoticeMessage message) {
        }
        public void onCoordRequest(int dpc, int ssn, int multiplicityIndicator) {
        ł
        public void onCoordResponse(int dpc, int ssn, int multiplicityIndicator) {
        }
        public void onState(int dpc, int ssn, boolean inService, int
multiplicityIndicator) {
        }
        @Override
        public void onPcState(int dpc, SignallingPointStatus status, int
restrictedImportanceLevel,
                        RemoteSccpStatus remoteSccpStatus) {
        }
}
```

Chapter 11. TCAP

The Transaction Capabilities Application Part (TCAP) is defined in ITU-T Recommendations Q.771-Q.775. TCAP allows services at network nodes to communicate with each other using an agreed-upon set of data elements. The primary purpose of TCAP is to facilitate multiple concurrent dialogs between the same sub-systems on the same machines, using Transaction IDs to differentiate these, similar to the way TCP ports facilitate multiplexing connections between the same IP addresses on the Internet.

11.1. Restcomm jSS7 TCAP Usage

The org.mobicents.protocols.ss7.tcap.api.TCAPStack interface defines the methods required to represent the TCAP Protocol Stack. TCAPStack exposes org.mobicents.protocols.ss7.tcap.api.TCAPProvider that interacts directly with the TCAPStack. TCAPProvider defines methods that will be used by TCAP User Part to create new org.mobicents.protocols.ss7.tcap.api.tc.dialog.Dialog to be sent across the network. TCAP User Part also allows to registerorg.mobicents.protocols.ss7.tcap.api.TCAP messages.

TCAPProvider also exposes org.mobicents.protocols.ss7.tcap.api.DialogPrimitiveFactory to create dialog primitives and org.mobicents.protocols.ss7.tcap.api.ComponentPrimitiveFactory to create components. Components are a means of invoking an operation at a remote node.

The UML Class Diagram is depicted in the figure below:

Figure 36. Restcomm jSS7 Stack TCAP Class Diagram

The org.mobicents.protocols.ss7.tcap.TCAPStackImpl is a concrete implementation of TCAPStack. The TCAP User Part gets access to TCAPProvider by doing JNDI lookup as explained in the SS7 Service.

```
InitialContext ctx = new InitialContext();
try {
    String providerJndiName = "java:/restcomm/ss7/tcap";
    this.tcapProvider = ((TCAPProvider) ctx.lookup(providerJndiName));
} finally {
    ctx.close();
}
```

The TCAP User Part should register the concrete implementation of TCListener with TCAPProvider to listen for incoming TCAP messages.

```
public class ClientTest implements TCListener{
    .....
    tcapProvider.addTCListener(this);
    ....
}
```

TCAP User Part leverages **TCAPProvider** to create a new Dialog. The components between the nodes are exchanged within this Dialog.

```
SccpAddress localAddress = new SccpAddress(RoutingIndicator
.ROUTING_BASED_ON_DPC_AND_SSN, 1, null, 8);
SccpAddress remoteAddress = new SccpAddress(RoutingIndicator
.ROUTING_BASED_ON_DPC_AND_SSN, 2, null, 8);
clientDialog = this.tcapProvider.getNewDialog(localAddress, remoteAddress);
```

The TCAP User Part leverages ComponentPrimitiveFactory to create new components. These components are sent using the dialog.

Below is a list of common scenarios using the TCAP stack :

- Creating a TCAP Dialog by invoking the methods TCAPProvider.getNewDialog() or getNewUnstructuredDialog()
- Adding components into a Dialog for sending by Dialog.sendComponent();
- Sending a TCAP message TC-UNI, TC-BEGIN, TC-CONTINUE, TC-END or TC-ABORT via Dialog.send() methods.
- Waiting for responses from a peer
- When the TCAP stack receives a message from a peer, events like TCListener.onTCUni(), onTCBegin(), onTCContinue(), onTCEnd(), onTCUserAbort(), onTCPAbort() will be invoked.
- After an Invoke component is received, a TCAP-User should process it and do one of the below:
 - $\circ~$ send a response (ReturnResult, ReturnResulLast components) or
 - send an error (ReturnError or Reject components) or
 - invoke Dialog.processInvokeWithoutAnswer() method if TCAP-Users will not answer to the Invoke.

```
//create some INVOKE
Invoke invoke = cpFactory.createTCInvokeRequest();
invoke.setInvokeId(this.clientDialog.getNewInvokeId());
OperationCode oc = cpFactory.createOperationCode();
oc.setLocalOperationCode(12L);
invoke.setOperationCode(oc);
//no parameter
this.clientDialog.sendComponent(invoke);
```

11.2. Restcomm jSS7 TCAP User Part Example

Below is a TCAP User Part example. This example creates a dialog and exchanges messages within a structured dialog. Refer to source for function calls.

```
package org.mobicents.protocols.ss7.tcap;
```

```
import javax.naming.InitialContext;
import javax.naming.NamingException;
import org.mobicents.protocols.ss7.indicator.RoutingIndicator;
import org.mobicents.protocols.ss7.sccp.parameter.SccpAddress;
import org.mobicents.protocols.ss7.tcap.api.ComponentPrimitiveFactory;
import org.mobicents.protocols.ss7.tcap.api.TCAPException;
import org.mobicents.protocols.ss7.tcap.api.TCAPProvider;
import org.mobicents.protocols.ss7.tcap.api.TCAPSendException;
import org.mobicents.protocols.ss7.tcap.api.TCListener;
import org.mobicents.protocols.ss7.tcap.api.tc.dialog.Dialog;
import org.mobicents.protocols.ss7.tcap.api.tc.dialog.events.TCBeginIndication;
import org.mobicents.protocols.ss7.tcap.api.tc.dialog.events.TCBeginRequest;

import org.mobicents.protocols.ss7.tcap.api.tc.dialog.events.TCPAbortIndication;
import org.mobicents.protocols.ss7.tcap.api.tc.dialog.events.TCUniIndication;
import org.mobicents.protocols.ss7.tcap.api.tc.dialog.events.TCUserAbortIndication;
import org.mobicents.protocols.ss7.tcap.api.tc.dialog.events.TerminationType;
import org.mobicents.protocols.ss7.tcap.asn.ApplicationContextName;
import org.mobicents.protocols.ss7.tcap.asn.comp.Invoke;
import org.mobicents.protocols.ss7.tcap.asn.comp.OperationCode;
/**
* Simple example demonstrates how to use TCAP Stack
* @author Amit Bhayani
*/
public class ClientTest implements TCListener {
    // encoded Application Context Name
    public static final long[] _ACN_ = new long[] { 0, 4, 0, 0, 1, 0, 19, 2 };
    private TCAPProvider tcapProvider;
    private Dialog clientDialog;
   ClientTest() throws NamingException {
        InitialContext ctx = new InitialContext();
        try {
            String providerJndiName = "java:/restcomm/ss7/tcap";
            this.tcapProvider = ((TCAPProvider) ctx.lookup(providerJndiName));
        } finally {
            ctx.close();
        }
        this.tcapProvider.addTCListener(this);
    }
```

```
public void sendInvoke() throws TCAPException, TCAPSendException {
        SccpAddress localAddress = new SccpAddress(RoutingIndicator
.ROUTING_BASED_ON_DPC_AND_SSN, 1, null, 8);
        SccpAddress remoteAddress = new SccpAddress(RoutingIndicator
.ROUTING_BASED_ON_DPC_AND_SSN, 2, null, 8);
        clientDialog = this.tcapProvider.getNewDialog(localAddress, remoteAddress);
        ComponentPrimitiveFactory cpFactory = this.tcapProvider
.getComponentPrimitiveFactory();
        // create some INVOKE
        Invoke invoke = cpFactory.createTCInvokeRequest();
        invoke.setInvokeId(this.clientDialog.getNewInvokeId());
        OperationCode oc = cpFactory.createOperationCode();
        oc.setLocalOperationCode(12L);
        invoke.setOperationCode(oc);
        // no parameter
        this.clientDialog.sendComponent(invoke);
        ApplicationContextName acn = this.tcapProvider.getDialogPrimitiveFactory
().createApplicationContextName(_ACN_);
        // UI is optional!
        TCBeginRequest tcbr = this.tcapProvider.getDialogPrimitiveFactory

```

11.3. Restcomm jSS7 TCAP statistic counters

Below is a list of provided by TCAP Stack statistic counters. Please see the info how to enable statistics in the following chapters: Statistics Enabled, Statistics.

Table 7. TCAP statistic counters

CounterType	Id	Description
Summary	TcUniReceived Count	A count of received TC-UNI messages

CounterType	Id	Description
Summary	TcUniSentCoun t	A count of sent TC-UNI messages
Summary	TcBeginReceiv edCount	A count of received TC-BEGIN messages
Summary	TcBeginSentCo unt	A count of sent TC-BEGIN messages
Summary	TcContinueRec eivedCount	A count of received TC-CONTINUE messages
Summary	TcContinueSen tCount	A count of sent TC-CONTINUE messages
Summary	TcEndReceived Count	A count of received TC-END messages
Summary	TcEndSentCou nt	A count of sent TC-END messages
Summary	TcPAbortRecei vedCount	A count of received TC-PROVIDER-ABORT messages
Summary	TcPAbortSentC ount	A count of sent TC-PROVIDER-ABORT messages
Summary	TcUserAbortRe ceivedCount	A count of received TC-USER-ABORT messages
Summary	TcUserAbortSe ntCount	A count of sent TC-USER-ABORT messages
Summary	InvokeReceive dCount	A count of received Invoke components
Summary	InvokeSentCou nt	A count of sent Invoke components
Summary	ReturnResultRe ceivedCount	A count of received ReturtResult components
Summary	ReturnResultSe ntCount	A count of sent ReturtResult components
Summary	ReturnResultLa stReceivedCou nt	A count of received ReturtResultLast components
Summary	ReturnResultLa stSentCount	A count of sent ReturtResultLast components
Summary	ReturnErrorRe ceivedCount	A count of received ReturnError components
Summary	ReturnErrorSe ntCount	A count of sent ReturnError components
Summary	RejectReceived Count	A count of received Reject components

CounterType	Id	Description
Summary	RejectSentCoun t	A count of sent Reject components
Summary	DialogTimeout Count	A count of received DialogTimeouts
Summary	DialogReleaseC ount	A count of received DialogReleases
Summary	AllEstablished DialogsCount	A count of all established Dialogs
Summary	AllLocalEstabli shedDialogsCo unt	A count of all established local originated Dialogs
Summary	AllRemoteEsta blishedDialogs Count	A count of all established remote originated Dialogs
Minimal	MinDialogsCou nt	A min count of established Dialogs
Maximal	MaxDialogsCou nt	A max count of established Dialogs
SummaryDoub le	AllDialogsDura tion	A total duration of all released Dialogs (in seconds)
Average	AverageDialogs Duration	An average duration of all released Dialogs (in seconds)
ComplexValue	OutgoingDialog sPerApplicatio ContextName	An outgoing Dialogs count per ApplicationContextNames (in string form)
ComplexValue	IncomingDialo gsPerApplicati oContextName	An incoming Dialogs count per ApplicationContextNames (in string form)
ComplexValue	OutgoingInvok esPerOperation Code	An outgoing Invokes count per OperationCodes
ComplexValue	IncomingInvok esPerOperation Code	An incoming Invokes count per OperationCodes
ComplexValue	OutgoingErrors PerErrorCode	An outgoing ReturtError count per ErrorCodes
ComplexValue	IncomingError sPerErrorCode	An incoming ReturtError count per ErrorCodes
ComplexValue	OutgoingReject PerProblem	An outgoing Reject count per Problem
ComplexValue	IncomingReject PerProblem	An incoming Reject count per Problem

Chapter 12. MAP

Mobile application part (MAP) is the protocol that is used to allow the network nodes within the Network Switching Subsystem (NSS) to communicate with each other in order to provide services such as roaming capability, text messaging (SMS), Unstructured Supplementary Service Data (USSD) and subscriber authentication.

MAP provides an application layer on which to build the services that support a network. This application layer provides a standardized set of services. uses the services of the GSM network, specifically the Signaling Connection Control Part (SCCP) and the Transaction Capabilities Application Part (TCAP).

For better understanding of this chapter you must be familiar with the specifications defined in GSM 09.02.

MAP has full implementation for USSD, SMS and LMS (Location Management Service) services and partial implementation for Mobility Services (updateLocation, sendAuthenticationInfo, anyTimeInterrogation, checkIMEI operations). You can find the list of implemented MAP messages here: MAPMessagesImplemented.ods. The document uses color coding to represent the status of the implementation:

Green

Fully Implemented

Red

Interface available (but not yet implemented)

Yellow

Implementation in progress

Restcomm jSS7 Any contribution to implement other messages are welcome. We will provide you with all the help that you may require initially.

12.1. jSS7 MAP

The methods required to represent the MAP Protocol Stack are defined in the interface org.mobicents.protocols.ss7.map.api.MAPStack which exposes org.mobicents.protocols.ss7.map.api.MAPProvider that interacts directly with the MAPStack. This interface defines the methods that will be used by any registered MAP-User application.

A MAP-User application must implement interfaces to listen for MAP messages and also implement interfaces for dialogue and component handling primitives. One such interface is org.mobicents.protocols.ss7.map.api.MAPDialogListener which must be implemented for listening associated with dialog events. Others are one or more interfaces for listening associated with component events based on org.mobicents.protocols.ss7.map.api.MAPServiceListener interface.

Below is a list of MAP Service Listener classes. A MAP-User interested in listening for messages

specific to a particular MAP Service must implement the corresponding MAPServiceListener.

LMS operations

org.mobicents.protocols.ss7.map.api.service.lsm.MAPServiceLsmListener

Mobility operations

org.mobicents.protocols.ss7.map.api.service.mobility.MAPServiceMobilityListener

OAM operations

org.mobicents.protocols.ss7.map.api.service.oam.MAPServiceOamListener

PDP context activation operations

org.mobicents.protocols.ss7.map.api.service.pdpContextActivation.MAPServicePdpContextActivat
ionListener

SMS operations

org.mobicents.protocols.ss7.map.api.service.sms.MAPServiceSmsListener

Supplementary operations

org.mobicents.protocols.ss7.map.api.service.supplementary.MAPServiceSupplementaryListener

A MAP-User interested in all the services must implement all the above Service Listener classes.

The org.mobicents.protocols.ss7.map.MAPStackImpl class is a concrete implementation of MAPStack. The MAP-User application gets a reference to MAPProvider by doing a JNDI lookup as explained in SS7 Service.

```
String providerJndiName = "java:/restcomm/ss7/map";
this.mapProvider = ((MAPProvider) ctx.lookup(providerJndiName));
...
```

To listen for incoming MAP Dialog and MAP Primitive messages, the MAP-User application should register the concrete implementation of MAPDialogListener with MAPProvider.

To listen for incoming MAP Service messages, the MAP-User application should register the concrete implementation of MAPServiceListener with the corresponding MAPServiceBase `. The following [class]`MAPServiceBase services are exposed by the MAPProvider:

Call handling service

org.mobicents.protocols.ss7.map.api.service.callhandling.MAPServiceCallHandling

LSM service

org.mobicents.protocols.ss7.map.api.service.lsm.MAPServiceLsm

Mobility service

org.mobicents.protocols.ss7.map.api.service.mobility.MAPServiceMobility

OAM service

org.mobicents.protocols.ss7.map.api.service.oam.MAPServiceOam

PDP context activation service

org.mobicents.protocols.ss7.map.api.service.pdpContextActivation.MAPServicePdpContextActivat ion

SMS service

org.mobicents.protocols.ss7.map.api.service.sms.MAPServiceSms

Supplementary service

org.mobicents.protocols.ss7.map.api.service.supplementary.MAPServiceSupplementary

Prior to using any MAP specific service, the corresponding service should be activated as shown below:

```
....
// Make the supplementary service activated
mapProvider.getMAPServiceSupplementary().acivate();
....
```

The MAP-User Application leverages:

- MAPParameterFactory to create instances of USSDString, ISDNAddressString and many other primitives that are used by MAP services.
- MAPSmsTpduParameterFactory to create instances of SMS TPDU primitives used for sending SMS messages like SmsDeliverTpdu or SmsSubmitTpdu.
- MAPErrorMessageFactory to create instances of MAP error messages like MAPErrorMessageSystemFailure.

12.2. jSS7 Sending a MAP request (processUnstructuredSS-Request as an example)

For sending a MAP request, you must do the following at the client side:

• Create a new MAP Dialog

```
// First create Dialog
SccpAddress origAddress = createLocalAddress();
ISDNAddressString origReference = client.getMAPProvider().getMAPParameterFactory().
    createISDNAddressString(AddressNature.international_number, NumberingPlan
.land_mobile, "31628968300");
SccpAddress destAddress = createRemoteAddress();
ISDNAddressString destReference = client.getMAPProvider().getMAPParameterFactory().
    createISDNAddressString(AddressNature.international_number, NumberingPlan
.land_mobile, "204208300008002");
currentMapDialog = mapProvider.getMAPServiceSupplementary().
    createNewDialog(MAPApplicationContext.getInstance(MAPApplicationContextName
.networkUnstructuredSsContext,
    MAPApplicationContextVersion.version2), origAddress,
    destReference, remoteAddress, destReference);
```

• Add an Invoke component (processUnstructuredSS-Request message)

```
// The dataCodingScheme is still byte, as I am not exactly getting how
// to encode/decode this.
byte ussdDataCodingScheme = 0x0f;
// The Charset is null, here we let system use default Charset (UTF-7 as
// explained in GSM 03.38. However if MAP-User wants, it can set its own
// impl of Charset
USSDString ussdString = paramFact.createUSSDString(ussdMessage, null);
ISDNAddressString msisdn = client.getMAPProvider().getMAPParameterFactory().
createISDNAddressString(AddressNature.international_number, NumberingPlan.ISDN,
"31628838002");
currentMapDialog.addProcessUnstructuredSSRequest(ussdDataCodingScheme, ussdString,
alertingPattern, msisdn);
```

• Send a TC-Begin message to the server peer

currentMapDialog.send();

• Wait for a response from the server

At the server side, when the TC-Begin message is received, the following sequence of events occur:

void MAPDialogListener. onDialogRequest(MAPDialog mapDialog, AddressString
destReference,

AddressString origReference, MAPExtensionContainer extensionContainer);

This is the request for MAP Dialog processing. A MAP-User can reject the Dialog by invoking the mapDialog.refuse() method.

This is followed by the events (one or more) corresponding to the incoming primitives. In this case it is:

```
void MAPServiceSupplementaryListener.onProcessUnstructuredSSRequest
(ProcessUnstructuredSSRequest procUnstrReqInd);
```

When processing component-dependant messages, you can add response components. In this case it is processUnstructuredSS-Response as an example:

```
USSDString ussdString = ind.getUSSDString();
String request = ussdString.getString();
// processing USSD request
String response = "Your balans is 100$";
// The dataCodingScheme is still byte, as I am not exactly getting how
// to encode/decode this.
byte ussdDataCodingScheme = 0x0f;
USSDString ussdResponse = paramFact.createUSSDString(response, null);
try {mapDialog.addProcessUnstructuredSSResponse(ind.getInvokeId(),
ussdDataCodingScheme, ussdResponse);
} catch (MAPException e) {// TODO Auto-generated catch
blocke.printStackTrace();
}
```

If preparing the response takes more time, you should return the control and prepare the answer asynchronously in a separate thread.

If error or reject primitives are included in a TCAP message, the following events occur:

```
public void onErrorComponent(MAPDialog mapDialog, Long invokeId, MAPErrorMessage
mapErrorMessage);
public void onProviderErrorComponent(MAPDialog mapDialog, Long invokeId,
MAPProviderError providerError);
public void onRejectComponent(MAPDialog mapDialog, Long invokeId, Problem problem);
```

After all incoming components have been processed, the event onDialogDelimiter(MAPDialog mapDialog); or in the case of TC-END, onDialogClose(MAPDialog mapDialog) is invoked. If all response

components have been prepared you can tell the stack to send the response:

- mapDialog.close(false); to send TC-END
- mapDialog.send(); to send TC-CONTINUE
- mapDialog.close(true); sends TC-END without any components (prearrangedEnd)

Instead of send() and close(boolean prearrangedEnd) methods you can invoke sendDelayed() or closeDelayed(boolean prearrangedEnd) methods. These methods are similar to send() and close() methods, but when these methods are invoked from MAP Service message handlers (component handler methods called by stack while parsing incoming components), real sending and dialog closing will occur only when all incoming component events and onDialogDelimiter() ` or `onDialogClose() is processed. If all response components have been prepared you should return the control and send a response when all components are ready.

In case of an error, you can terminate a MAP dialog in any method by invoking

mapDialog.abort(mapUserAbortChoice); - sends TC-U-ABORT primitive

If there are no local actions or there is no response from a peer for a long time, a timeout occurs and the following methods are invoked:

- MAPDialogListener.onDialogTimeout(MAPDialog mapDialog);
- MAPServiceListener.onInvokeTimeout(MAPDialog mapDialog, Long invokeId);

In the onDialogTimeout() method you can invoke mapDialog.keepAlive(); to prevent a Dialog from closing. For preventing an Invoke timeout you should invoke resetInvokeTimer(Long invokeId); before onInvokeTimeout() occurs.

12.3. jSS7 MAP Usage

```
package org.mobicents.protocols.ss7.map;
import javax.naming.InitialContext;
import javax.naming.NamingException;

```

Chapter 13. CAP

The (Customized Applications for Mobile network Enhanced Logic) Application Part (CAP) protocol is used by network operators to provide their subscribers with operator specific services even when roaming outside the HPLMN. provides services such as prepaid roaming services, fraud control, special numbers and closed user groups (e.g., office extension numbers that work everywhere). CAP has been defined in four versions (phases), each of which has an accompanying specification that builds upon the previous phase. This application layer provides a standardized set of services. uses the services of the SS7 network, specifically the Signaling Connection Control Part (SCCP) and the Transaction Capabilities Application Part (TCAP)

For better understanding of this chapter you must be familiar with the specifications defined in 3GPP TS 22.078 (service aspects) and 3GPP TS 23.078 (technical realization).

Restcomm jSS7 CAP has full implementation for Phase 1 and Phase 2. The list of implemented operations can be found at CAPMessagesImplemented.ods. You can find the list of implemented operations here: CAPMessagesImplemented.ods. The document uses color coding to represent the status of the implementation:

Green

Fully Implemented

Red

Interface available (but not yet implemented)

Yellow

Implementation in progress

Blue

Implemeted only for CAP V2 and not available for CAP V3 and V4

Restcomm jSS7 Any contribution to implement other messages are welcome. We will provide you with all the help that you may require initially.

13.1. jSS7 CAP

The org.mobicents.protocols.ss7.cap.api.CAPStack interface defines the methods required to represent CAP Protocol Stack. CAPStack exposes org.mobicents.protocols.ss7.cap.api.CAPProvider that interacts directly with CAPStack. This interface defines the methods that will be used by any registered CAP-User application. CAP-User application must implement interfaces to listen for CAP messages and for dialogue and component handling primitives. One interface is org.mobicents.protocols.ss7.cap.api.CAPDialogListener (listening associated with dialog events). Others are one or more interfaces for listening to messages associated with component events based on org.mobicents.protocols.ss7.cap.api.CAPServiceListener interface.

Each CAP-User interested in listening to messages specific to a CAP Service must implement the

specific CAPServiceListener.

- CAP-User interested only in circuit switched call operations implements org.mobicents.protocols.ss7.cap.api.service.circuitSwitchedCall. CAPServiceCircuitSwitchedCallListener
- CAP-User interested only in GPRS operations implements org.mobicents.protocols.ss7.cap.api.service.gprs.CAPServiceGprsListener
- CAP-User interested only in SMS operations implements org.mobicents.protocols.ss7.cap.api.service.sms.CAPServiceSmsListener

CAP-User interested in all the services must implement all the service listener classes.

The org.mobicents.protocols.ss7.cap.CAPStackImpl is a concrete implementation of CAPStack. The CAP-User application gets access to CAPProvider by doing a JNDI look-up as explained in SS7 Service.

```
String providerJndiName = "java:/restcomm/ss7/cap";
this.capProvider = ((CAPProvider) ctx.lookup(providerJndiName));
...
```

The CAP-User application should register the concrete implementation of CAPDialogListener with CAPProvider to listen for incoming CAP Dialog and CAP Primitive messages. The CAP-User application should register the concrete implementation of CAPServiceListener with corresponding CAPServiceBase ` to listen for incoming CAP Service messages. Following CAPServiceBase are exposed by [class]`CAPProvider.

- For circuit switched call service org.mobicents.protocols.ss7.cap.api.service.circuitSwitchedCall. CAPServiceCircuitSwitchedCall
- For GPRS service org.mobicents.protocols.ss7.cap.api.service.gprs.CAPServiceGprs
- For SMS service org.mobicents.protocols.ss7.cap.api.service.sms.CAPServiceSms

Before any CAP specific service can be used, the corresponding service should be activated as shown below:

```
// Make the circuitSwitchedCall service activated
capProvider.getCAPServiceCircuitSwitchedCall().acivate();
....
```

The CAP-User Application leverages:

- MAPParameterFactory to create instances of IMSI, ISDNAddressString and many other MAP primitives that are used by CAP services.
- CAPParameterFactory to create instances of CAP primitives that are used by CAP services.
- ISUPParameterFactory to create instances of ISUP primitives that are used by CAP services.
- **INAPPParameterFactory** to create instances of INAP primitives that are used by CAP services.
- CAPErrorMessageFactory to create instances of CAP error messages like CAPErrorMessageSystemFailure.

```
MapParameterFactory mapParamFact = capProvider.getMapServiceFactory();
CapParameterFactory capParamFact = capProvider.getCapServiceFactory();
ISDNAddressString msisdn = mapParamFact.createISDNAddressString(
        AddressNature.international_number, NumberingPlan.ISDN,
        "31628838002");
BCSMEvent ev = capParamFact.createBCSMEvent(EventTypeBCSM.routeSelectFailure,
        MonitorMode.notifyAndContinue, null, null, false);
```

13.2. jSS7 Sending a CAP request (InitialDPRequest as an example)

For sending a CAP request you must do the following at the SSF side:

• Create a new CAP Dialog

• Add an Invoke component (InitialDPRequest message)

```
int serviceKey = 1;
CalledPartyNumber calledPartyNumber = client.getCAPProvider().
    getISUPParameterFactory().createCalledPartyNumber();
calledPartyNumber.setAddress("552348762");
calledPartyNumber.setNatureOfAddresIndicator(NAINumber. NAI INTERNATIONAL NUMBER);
calledPartyNumber.setNumberingPlanIndicator(CalledPartyNumber._NPI_ISDN);
calledPartyNumber.setInternalNetworkNumberIndicator(CalledPartyNumber._INN_ROUTING_ALL
OWED);
CalledPartyNumberCap calledPartyNumberCap = client.getCAPProvider().
    getCAPParameterFactory().createCalledPartyNumberCap(calledPartyNumber);
CallingPartyNumber callingPartyNumber = client.getCAPProvider().
    getISUPParameterFactory().createCallingPartyNumber();
callingPartyNumber.setAddress("55998223");
callingPartyNumber.setNatureOfAddresIndicator(NAINumber._NAI_INTERNATIONAL_NUMBER);
callingPartyNumber.setNumberingPlanIndicator(CalledPartyNumber. NPI ISDN);
callingPartyNumber.setAddressRepresentationREstrictedIndicator(CallingPartyNumber._APR
I ALLOWED);
callingPartyNumber.setScreeningIndicator(CallingPartyNumber. SI NETWORK PROVIDED);
CallingPartyNumberCap callingPartyNumberCap = client.getCAPProvider().
    getCAPParameterFactory().createCallingPartyNumberCap(callingPartyNumber);
LocationNumber locationNumber = client.getCAPProvider().getISUPParameterFactory().
    createLocationNumber();
locationNumber.setAddress("55200001");
locationNumber.setNatureOfAddresIndicator(NAINumber._NAI_INTERNATIONAL_NUMBER);
locationNumber.setNumberingPlanIndicator(LocationNumber._NPI_ISDN);
locationNumber.setAddressRepresentationRestrictedIndicator(LocationNumber. APRI ALLOWE
D);
locationNumber.setScreeningIndicator(LocationNumber._SI_NETWORK_PROVIDED);
locationNumber.setInternalNetworkNumberIndicator(LocationNumber. INN ROUTING ALLOWED);
LocationNumberCap locationNumberCap = client.getCAPProvider().
getCAPParameterFactory().
    createLocationNumberCap(locationNumber);
ISDNAddressString vlrNumber = client.getCAPProvider().getMAPParameterFactory()
        .createISDNAddressString(AddressNature.international number,
        NumberingPlan.ISDN, "552000002");
LocationInformation locationInformation = client.getCAPProvider
().getMAPParameterFactory()
        .createLocationInformation(10, null, vlrNumber, null,
        null, null, null, vlrNumber, null, false, false, null, null);
currentCapDialog.addInitialDPRequest(serviceKey, calledPartyNumber,
callingPartyNumber,
        null, null, null, locationNumber, null, null, null, null, null,
        eventTypeBCSM, null, null, null, null, null, null, false,
        null, null, locationInformation, null, null, null, null, null, false, null);
```

• Send a TC-Begin message to the server peer

```
// This will initiate the TC-BEGIN with INVOKE component
currentCapDialog.send();
```

• Wait for a response and other instructions from the SCF

At the SCF side when the TC-Begin message is received, the following sequence of events occur:

This is the request for CAP Dialog processing. A CAP-User can reject the Dialog by invoking capDialog.abort(CAPUserAbortReason abortReason) method.

Then the incoming primitives corresponding events (one or more) occur. In this case it is

void CAPServiceCircuitSwitchedCallListener.onInitialDPRequest(InitialDPRequest ind);

When processing component-dependant messages you can add response components or add other Invoke requests. In this case it is RequestReportBCSMEventRequest as an example:

```
ArrayList<BCSMEvent> bcsmEventList = new ArrayList<BCSMEvent>();
BCSMEvent ev = this.capProvider.getCAPParameterFactory().createBCSMEvent(
    EventTypeBCSM.routeSelectFailure, MonitorMode.notifyAndContinue,
    null, null, false);
bcsmEventList.add(ev);
ev = this.capProvider.getCAPParameterFactory().createBCSMEvent(EventTypeBCSM
.oCalledPartyBusy,
    MonitorMode.interrupted, null, null, false);
bcsmEventList.add(ev);
ev = this.capProvider.getCAPParameterFactory().createBCSMEvent(EventTypeBCSM.
oNoAnswer,
    MonitorMode.interrupted, null, null, false);
bcsmEventList.add(ev);
ev = this.capProvider.getCAPParameterFactory().createBCSMEvent(EventTypeBCSM.oAnswer,
    MonitorMode.notifyAndContinue, null, null, false);
bcsmEventList.add(ev);
LegID legId = this.capProvider.getINAPParameterFactory().createLegID(true, LegType
.leq1);
ev = this.capProvider.getCAPParameterFactory()
        .createBCSMEvent(EventTypeBCSM.oDisconnect, MonitorMode.notifyAndContinue,
legId, null, false);
bcsmEventList.add(ev);
legId = this.capProvider.getINAPParameterFactory().createLegID(true, LegType.leg2);
ev = this.capProvider.getCAPParameterFactory().createBCSMEvent(EventTypeBCSM
.oDisconnect,
    MonitorMode.interrupted, legId, null, false);
bcsmEventList.add(ev);
ev = this.capProvider.getCAPParameterFactory().createBCSMEvent(EventTypeBCSM.oAbandon,
    MonitorMode.notifyAndContinue, null, null, false);
bcsmEventList.add(ev);
currentCapDialog.addRequestReportBCSMEventRequest(bcsmEventList, null);
currentCapDialog.send();
```

If preparing the response takes time, you should return the control and prepare the answer in a separate thread.

If error or reject primitives are included into a TCAP message the following events occur:

After all incoming components have been processed, the event onDialogDelimiter(CAPDialog capDialog); event is invoked (or onDialogClose(CAPDialog capDialog) in TC-END case). If all response components have been prepared you can tell the Stack to send response:

- capDialog.close(false); to send TC-END
- capDialog.send(); to send TC-CONTINUE
- capDialog.close(true); sends TC-END without any components (prearrangedEnd)

Instead of the methods send() and close(boolean prearrangedEnd), you can invoke sendDelayed() or closeDelayed(boolean prearrangedEnd). These methods are the same as send() and close(boolean prearrangedEnd) methods, but when invoking them from events of parsing incoming components real sending and dialog closing will occur only when all incoming component events and onDialogDelimiter() or onDialogClose() would be processed. If all response components have been prepared you should return the control and send a response when all components are ready.

In case of an error, you can terminate a CAP dialog in any method by invoking:

• capDialog.abort(CAPUserAbortReason abortReason); - sends TC-U-ABORT primitive

If there are no local actions or no response from a remote size for a long time, timeouts occur and the following methods are invoked:

- CAPDialogListener.onDialogTimeout(CAPDialog capDialog);
- CAPServiceListener.onInvokeTimeout(CAPDialog capDialog, Long invokeId);

In the onDialogTimeout() method you can invoke capDialog.keepAlive(); to prevent a Dialog from closing. For preventing an Invoke timeout you should invoke resetInvokeTimer(Long invokeId); (before onInvokeTimeout() occurs).

13.3. jSS7 CAP Usage

```
package org.mobicents.protocols.ss7.cap;
import org.mobicents.protocols.ss7.cap.api.EsiBcsm.OAnswerSpecificInfo;
import org.mobicents.protocols.ss7.cap.api.EsiBcsm.ODisconnectSpecificInfo;
import org.mobicents.protocols.ss7.cap.api.isup.CalledPartyNumberCap;
import org.mobicents.protocols.ss7.cap.api.isup.CallingPartyNumberCap;
import org.mobicents.protocols.ss7.cap.api.isup.CauseCap;
import org.mobicents.protocols.ss7.cap.api.isup.LocationNumberCap;
import org.mobicents.protocols.ss7.cap.api.primitives.EventTypeBCSM;
import org.mobicents.protocols.ss7.cap.api.primitives.ReceivingSideID;
import org.mobicents.protocols.ss7.inap.api.primitives.LegType;
import org.mobicents.protocols.ss7.inap.api.primitives.MiscCallInfo;
import org.mobicents.protocols.ss7.inap.api.primitives.MiscCallInfoMessageType;
import org.mobicents.protocols.ss7.indicator.RoutingIndicator;
import org.mobicents.protocols.ss7.isup.message.parameter.CalledPartyNumber;
import org.mobicents.protocols.ss7.isup.message.parameter.CallingPartyNumber;
import org.mobicents.protocols.ss7.isup.message.parameter.CauseIndicators;
import org.mobicents.protocols.ss7.isup.message.parameter.LocationNumber;
import org.mobicents.protocols.ss7.isup.message.parameter.NAINumber;
import org.mobicents.protocols.ss7.map.api.primitives.AddressNature;
import org.mobicents.protocols.ss7.map.api.primitives.ISDNAddressString;
import org.mobicents.protocols.ss7.map.api.primitives.NumberingPlan;
```
```

Chapter 14. SS7 Simulator

SS7 Simulator is an application for testing the Restcomm jSS7 and understanding its functionality. The test cases will allow you to conduct various test scenarios and explore the Stack. The Simulator is also a good example of how to use this Stack. For details on installing the Simulator please refer to the Installation Guide. To know more about Running the Simulator please refer to Running Restcomm jSS7 Simulator in this guide.

Before running a test all relevant layers of the Simulator must be configured. After running a test, you can perform some actions depending on the test. The results of the test are emitted as "notifications". Notifications are displayed in the GUI interface of the Simulator and JConsole application (which is also a GUI interface). Notifications are also written into a file "<host name>.log" (for example "a1.log") as well as printed onto a console.

14.1. Configuring Restcomm jSS7 Simulator

You must configure all relevant layers and the Testing Task prior to running a test with the Simulator. For details on how to launch the form for configuring the simulator, refer to [_procedure_test_simulator].

14.1.1. SCCP Layer of the Simulator

SCCP layer supports message processing in two modes:

- Route on DPC and SSN mode
- Route on GlobalTitle mode

For both modes you must set the following options:

- Remote SPC
- Local SPC
- Network indicator
- Remote SSN
- Local SSN

When the SCCP layer is started, the following are created:

- Mtp3ServiceAccessPoint (using Local SPC and Network indicator) with a single Mtp3Destination (Remote SPC, all SLS's)
- RemoteSpc (using Remote SPC)
- RemoteSsn (using Remote SPC and Remote SSN)

For "Route on GlobalTitle" mode there are few extra options as below:

• GlobalTitle type ("Nature of address indicator only", "Translation type only", "Translation type, numbering plan and encoding scheme", "Translation type, numbering plan, encoding scheme

and NOA ind"), the last choice is default.

- AddressNature
- NumberingPlan
- Translation type (those four options are used for CalledPartyAddress, CallingPartyAddress and routing rules)
- CallingPartyAddress digits

If the "Route on GlobalTitle" mode is used, two rules for routing are created when the SCCP layer is started. All remotely originated messages are routed to a local user, All locally originated messages are routed to a remote user (to a peer with Remote SPC address).

SCCP layer provide CalledPartyAddress and CallingPartyAddress for upper layers and test cases. When "Route on DPC and SSN" mode is used, these are ROUTING_BASED_ON_DPC_AND_SSN with no GlobalTitle, pc=Local SPC (for CallingPartyAddress) or Remote SSN (for CalledPartyAddress), SSN=Local SSN and Remote SSN accordingly.

When "Route on GlobalTitle" mode ROUTING_BASED_ON_GT is used:

- CallingPartyAddress is created based on CallingPartyAddress digits and Local SSN.
- CalledPartyAddress is created using digits and SSN that are supplied by upper levels or test cases.

14.2. SS7 Simulator Test Cases

14.2.1. USSD Server

UssdServer test can work in manual and automatic modes. In the manual mode a user manually inserts the response message value and sends ProcessUnstructuredSs response (or UnstructuredSs request) to the Ussd client. In the automatic mode UssdServer automatically sends a predefined message as an ProcessUnstructuredSs response ("Auto sending ProcessUnstructuredSsResponse" option) or automatically sends a predefined message as an UnstructuredSs request and then sends a predefined message ProcessUnstructuredSs response ("Auto sending Unstructured_SS_Request then after response sending ProcessUnstructuredSsResponse" option). Use "Auto sending ProcessUnstructuredSsResponse" option for UssdServer if UssdClient is used for a load test ("Auto sending ProcessUnstructuredSSRequest"). For load tests we recommend to check the option "One notification for 100 dialogs" for preventing too many notifications when load testing.

UssdServer test can perform followng tasks:

- Sending a ProcessUnstructuredSs response / UnstructuredSs request in automatic or manual modes. Ussd Client must initiate a dialog using ProcessUnstructuredSs request.
- Manually sending an UnstructuredSsNotify.

USSD test server setting	s			
Msisdn value

	aluan fan side A			
	alues for side A Load default values for side B			
Reload	Save Cancel			

Figure 38. Ussd Server settings form

14.2.2. USSD Client

UssdClient test can perform following tasks:

- Sending a ProcessUnstructuredSs request, waiting for the answer and displaying the answer
- Sending a UnstructuredSs response as an answer for UnstructuredSs request
- Receiving UnstructuredSs notify and displaying it
- Special case for load testing: Sending to the Ussd server a flow of ProcessUnstructuredSs requests without stopping (and receiving responses).

For working in the manual mode select the option "Manual operation", for auto sending messages the option "Auto sending ProcessUnstructuredSSRequest". You can send ProcessUnstructuredSs request and UnstructuredSs response only manually by inserting a message text and pressing buttons. For working in the auto mode you should define the string of auto processUnstructuredSs request and the count of maximum active MAP dialogs (default value is 10). The more dialogs is defined the more messages per second will be sent. Msisdn, data coding schema and alerting pattern values should be also configured before test starting. For the auto mode we recomment to check the option "One notification for 100 dialogs" for preventing too many notifications when load testing.

You can send ProcessUnstructuredSs request and UnstructuredSs response manually by inserting a message text and pressing buttons. You can not send a new ProcessUnstructiredSs request till the response for previos request has been received (or till dialog timeout). You can also manually close the current dialog by pressing "Close current dialog" button.

USSD test client settings	and the second second	×
General SRI response	e

Figure 39. Ussd Client settings form

14.2.3. SMS Server

SMS Server simulates the behavior of SMSC, it can:

- Send sendRoutingInfoForSM to the HLR and receive the response
- Send mt-forwardSM to the VLR and receive the response
- Send sendRoutingInfoForSM to the HLR, receive the response and send mt-forwardSM using data from the first request

• Receive mo-forwardSM request from VLR and display the received message

We need to set the following options to SMS server:

- AddressNature and NumberingPlan for AddressString creation
- TypeOfNumber and NumberingPlanIdentification SMS tpdu addresses
- MAP protocol version (1, 2 or 3) (version 3 is default)
- Character set for SMS message encoding (GSM7 or UCS2)
- Origination Service center address string (this address must be equal the SCCP layer CallingPartyAddress digits)
- HLR and VLR SSN values (default values are 8 and 6)

if you want to use SMS Server and SMS Client for sending SMS to each other: set HLR SSN at SMS Server the equal value that VLR SSN (8 in our case)

SMS test server settings		×

Figure 40. SMS client settings form

After starting SMS server you can:

- For sending sendRoutingInfoForSM ("Send SRIForSM" button) we should set "Destination ISDN number"
- For sending sendRoutingInfoForSM and then mt-forwardSM ("Send SRIForSM + MtForwardSM" button) we should set "Message text", "Destination ISDN number" and "Origination ISDN number"
- For sending mt-forwardSM only ("Send MtForwardSM" button) we should set "Message text", "IMSI", "VLR number" and "Origination ISDN number"

14.2.4. SMS Client

SMS Client simulates the behavior of HLR or VLR, it can:

- Receive sendRoutingInfoForSM from SMSC and send as a response predefined IMSI and VLR number
- Receive mt-forwardSM from SMSC and display the received message
- Send mo-forwardSM to the SMSC

We need to set the following options to SMS client:

- AddressNature and NumberingPlan for AddressString creation
- TypeOfNumber and NumberingPlanIdentification SMS tpdu addresses
- MAP protocol version (1, 2 or 3) (version 3 is default)
- Character set for SMS message encoding (GSM7 or UCS2)
- Destination Service center address string (this address must be equal the SCCP layer CallingPartyAddress digits)
- SMSC SSN value (default value is 8)
- IMSI and VLR addresses values that will be used when responding on sendRoutingInfoForSM

Figure 41. SMS client settings form

After starting SMS client you can:

- For sending mo-forwardSM ("Send MoForwardSM" button) we should set "Message text", "Destination ISDN number" and "Origination ISDN number"
- When recieving sendRoutingInfoForSM client automatically generate a response with preconfigured IMSI and VLR address

14.2.5. CAMEL SCF part

CAMEL SCF part simulates the behavior of CAMEL Service Control Function, it can:

- Send InitiateCallAttempt message to CAMEL SSF
- Send ApplyCharging message to CAMEL SSF
- Send Cancel message to CAMEL SSF
- Send Connect message to CAMEL SSF
- Send Continue message to CAMEL SSF

- Send ReleaseCall message to CAMEL SSF
- Send RequestReportBCSMEvent message to CAMEL SSF

We need to set the following options to CAMEL SCF:

• CAP Apllication content

Parameters of messages are hardcorded in current version and can not be configured.

CAP SCF test settings	
CAP application context	CAP_V4_capscf_ssfGeneric 23.3.8

- For initiating of CAP dialog and sending InitiateCallAttempt press "InitiateCallAttempt" button.
- For continuing of CAP dialog with sending ApplyCharging, Cancel, Connect, Continue, ReleaseCall or RequestReportBCSMEvent press corresponded buttons.
- For ending of CAP dialog press "Close Dialog" button.

14.2.6. CAMEL SSF part

CAMEL SSF part simulates the behavior of CAMEL Service Switching Function, it can:

- Send InitialDP message to CAMEL SCF
- Send AssistRequestInstructions message to CAMEL SCF
- Send ApplyChargingReport message to CAMEL SCF
- Send EventReportBCSM message to CAMEL SCF

We need to set the following options to CAMEL SSF:

• CAP Apllication content

Parameters of messages are hardcorded in current version and can not be configured.
CAP SSF test settings	×
CAP application context	CAP_V1_gsmSSF_to_gsmSCF 0.50.0

After CAMEL SSF server starting you can:

- For initiating of CAP dialog and sending InitialDP or AssistRequestInstructions message press corresponded button.
- For continuing of CAP dialog with sending ApplyChargingReport or EventReportBCSM press corresponded buttons.
- For ending of CAP dialog press "Close Dialog" button.

14.2.7. ATI Server

ATI operation server task can be used for responding for AniTimeInterrogation MAP request. There are no configurable options for this mode now. SS7 Simulator will auto respond with ARI response with hardcoded parameters.

ATI Server test can perform followng tasks:

• Auto sending of ATI Response.

14.2.8. ATI Client

ATI Client test can perform following tasks:

• Sending a AnyTimeInterrogation MAP (ATI) request and displaying of ATI response.

For sending of ATI Request we need to specify IMSI / MSISDN digits and push "Send ATI Request" button.

Before running of ATI Client a user need to specify parameters:

- Subscriber identity type (IMSI / MSISDN (default)).
- AddressNature and NumberingPlan for AddressString Creation.
- Requested info which parameters will be requested from ATI server.
- GSM SCF address digits.

ATI test client settings	in Line	x

Chapter 15. Trace Parser Tool

Restcomm jSS7 Trace Parser is a simple tool that can parse trace capture data files (of some formats) and log its content in some log file in a text form. This tool can be very handy to debug the flow of SS7 messages.

15.1. Running Restcomm jSS7 Trace Parser

The Restcomm jSS7 Stack comes with a Trace Parser module. You can install and run the module on any machine.

1. Change the working directory to the bin folder in the Simulator's installation directory.

```
downloads]$ cd mobicents-jss7-<version>/ss7/mobicents-ss7-traceparser/bin
```

2. (Optional) Ensure that the *run.sh* start script is executable.

bin\$ chmod +x run.sh

3. Execute the *run.sh* Bourne shell script.

bin\$./run.sh

4. Result: This will launch the GUI application as shown in the figure below:

SS7 Trace Parser		
Trace file type O Acterna O Simple sequence	◯ Hex stream	
Protocol MAP O CAP O ISUP		
Trace file path C:\01\a1.pcap		
ApplicationContext filter		
DialogId filter		
Opc / Dpc filter (Ex: "120,130")		
Messages logging		
Message log file path		
C:\111\MsgLog.txt		
✓ Store in the log TCAP message source data		
✓ Write dialog portion details		
Vrite components portion details		
✓ Recording of dialog message message chains		
Dialog message message chains log file path		
C:\111\DialogMessageChain.txt		
Messages performed 4812 Start Stop Get statistic in	ifo	

Figure 45. Running Trace Parser

15.2. Configuring Trace Parser

Once trace parser is started user can configure tool depending on requirements as explained below

- Trace file type : User can configure a trace file type for parsing. Possible values are:
 - $\circ~$ Acterna file format of logs of some Acterna family devices
 - Simple sequence binary file format that content consists of several records. When you have some unsupported data format you can convert your data into this format. Each record has the following structure:
 - 2 bytes of binary encoded integer value with record length
 - without two length bytes (less significant byte is first) binary code of legacy SS7 message (Routing label and user data)

- PCAP pcap wireshark file format. DLT_EN10MB, DLT_LINUX_SLL and DLT_MTP3 network formats are supported now
- $\,\circ\,$ Hex stream special encoded hex text file format, it is not covered in this manaul.
- Protocol: MAP, CAP or ISUP defines which protocol will be parsed.
- Trace file path: you have to select a file for parsing
- ApplicationContext filter this value is used only for MAP protocol. It is integer value and used for message filtering. The value of this field is 7th number of MAP application context. For example for USSD services this value is 19. So can be filtered only all versions for a concrete application context.
- DialogId filter for MAP and CAP protocols it is possible to filter one dialog chain. Two values in the integer form (as they are present in the text log of Trace Parser) can be used (to define origination and destination TCAP Transaction Id). Also can be only one Integer value used.
- OPC / DPC filter this filter filters messages only for defined SS7 point codes. You can define several point codes, for example: "123,124,125". Use this filter when trace file contains a lot of data between several point codes and you want to select messages.
- Message logging User have to define a file where text parsed data will be stored. User also needs to define which details will be saved into a log (TCAP message source data, MAP/CAP dialog portion details, components portion details)
- Recording of dialog message chains log user can write another log that contains trace of which DPC / OPC nodes dialogs are sent. Look at log format for other details. If there are several dialogs with the same path they will be present only once in the log.

User can start parsing with the button "Start", stop with the button "Stop". After the parsing process is finished, user can get some statistic info like how many different TCAP primitives are exchanged, messages for separate Application contexts and operational codes.
